The Ed tor is always g at it receive for examination illustrated articles on subjects of it sely interest. If the phots graphs are short, the articles of set and the facts cathered is, the contributions will receive appeal attention. Accepted articles will be used for at rent or smace reads.

RETROSPECT OF THE YEAR 1909 Explorati

The year 1909 will forever be famous in the annals of scientific accompilehment as having witnessed the successful culmination of the agelong quest for the North Pole and the achievement of Commander Rob ert E Peary of the United States navy in finally reach ert E Peary of the United States navy in simally reach ing this theoretical point at the done of the world after twenty three years of practically uninterrupted endeavor will stand as the most difficult (east of geographical exploration in the history of the world it was eminently disting that Peary should be the first to reach the North Pole for among all the Arctic apploves he was easily the first in practical When he announ knowledge and experience When he announced to the world on September 5th that on April 6th 1909 he had

knowledge and superiscoe When he announced to the world on Beginseler fith that on April 5th 1980 he had reached the covered good his word was excepted with continuous and the world of this tribinant has been tacitly indicorned by the various learned sonieties throughout the world in our lessue of September 11th commenting upon the freely expressed double of Dr. Cooke claim that he also and a year earlier had reached the North Pole we wrote. The man who can look Death full in the face throughout all the cruel sufferings of a two years search for the sect of the frozen North built upon lines too holds to dentit of the slightest with the same conviction that the Danith submitting the pole at large accepted Dr. Cooke stupendous claim in a spirit of loyal belief which the control of the seculied data by a committee of the receipt of his sec-alled data by a committee of the trection of his sec-alled data by a committee of the linesting the seculied data by a committee of the linesting the contribution of the country equicity reported that Cooks statement was that thristed in a New York newspaper. But the as that printed in a New York newspaper that the copy of his notebooks contained no original astron ical observations whatsoever but only results that the documents presented were inexcusably lacking in information which would prove that the astronomical observations therein referred to were really made and that they contained no details remarding the practical work of the expedition and the sledge journey which would enable the committee to determine their reliability

By this sweeping repudiation of Dr Cooks claims the University of copenhagen has drawn the final cur-tain upon one of the most spectacular dramas of auda clous imposiure in the history of geographical re-

Second only in importance to Peary s achievement in reaching the North Pole was Lieut Shackleton e we derful journey in the Antarctic when he succeeded derful journey in the Antarctic whan he succeeded in reaching lattinde 88 degrees 28 minutes south and arrived within 111 mire of the South Pole Shankle-ton passed the very point reached by Srott in 1963 pushed on for 125 miles and was defeated in his quest pusses on 107 1/25 miles and was cereated in his quest by hunger faiture sickness and the loss of his deps and pooles. He discovered eight new and distinct mountain ranges and over one hundred mountains and ascended Mount Erebus the most southerly vol (ano The south magnetic pole was reached at 73 gegress 15 minutes

Civil Engineeric

With the single exception of the harbor at Dover the part year has not been notable for the completion of any engineering works of the first magnitude. This stupendous work by which a harbor capable of feat-

ing a whole fiest of the largest warships has been
"wrested from one of the stormiest ness in the world,
consists of an aggregate length of over two miles of
breakwater much of which is nearly 100 feet in
height from its foundation to its creet. It incloses about one square mile of area and cost so

million delays
in spits of many predictions of failure the Unitial
Blains government through its army segment, is
building the Planman Canal with a repolity segment
agains well for its opening by January int, 1915. Ower
one half of the nerowation at the Culeirar cat has one
done and if we include the work done by the French
one and if we include the work done by the French
one and if we include the work done by the French
on the contingent of the considered as two-chirals completed
On the Atlantic side between three and four miles
of the entrance channel have been completed on
the Parific side the channel is open to full depth
on the Parific side the channel is open to full depth
on about five miles At (datum the lock exeruthes to
so far done that the laying of the concrete four and
the building or the walls is well under year and over

so far done that the laying of the concrete floor and the building of the walls is well under way and over eighty thousand cubic yards are already in place The cut for the splitway has been completed and here also concreting is making good progress. The method of building the Gatun dam by hydraniic depositing is being followed with every promise of securing a per fectly watertight structure The locks which will be in pairs will be 110 feet in width with a usable length in pairs will be 110 feet in width with a mashle length of 1 000 feet. They will be provided with an extra pair of beavy mitering gates to act as collision bulk heads. Plans have been completed for an emergancy dam at the head of the locks which in the event of dam at the head of the locks which in the event of a gate being carried away will be swring across the entrance and wickets resting on girders extending from the hridge to silla below will be successively low eved until the flow of water is cut off Throughout the whole length of the canal the method of excavation by whole length of the canal the method of accaration by seam aboved has been eminently successful and during the month of March a maximum record of excavation was reached of 380.437 cnb, yards. The health of sickness and mortality is now less than in some parts of the United States. The increasing size of ships both merchant marine and naval has fed the Gramm government to undertake a great calargement says both sevenant marries and navial also socious of Cerman government to undertaks a great calargement to defend the sevenant s Baratahle Bay to Bucarde Bay It will have a free width of 200 feet a least depth of 25 feet and a high water depth of about 30 feet. The sailing distance between New York and Boston will be shortened and vessels will avoid the perits of the outside trip around Claps Cod Furthermore it will serve as the first link in a chain of interior waterways by way of the control to the control of the cont Long Island Sound New York Bay and the Ravitan and Delaware Rivers to Chesapeake Bay During the year the agitation for the construction of a waterway from the agitation for the construction of a waterway from the Lakes to the Gulf has been exceedingly active aithough the advocates of this great scheme were dis-couraged by an adverse report of the board of govern ment engineers appointed to investigate the problem This board reported that although the construction a 14 feet channel was feasible there was not suffic a 1 feet channel was feasible there was not sufficient truth in sight to warrant the expenditure to 150 000 000 that the whole project would feet The 510 000 000 that the whole project would feet The great Los Angeles Aqueduct which contains of the Panama and State Barpe canalis the largest try drautic angineering work in progress is now about half completed. This wonderful structure will be convenient gas 500 000 000 gallons of water per day from the Sitera Nevadarka Structures over the Molave for the Panama Structures and for brigation.

Throughout the year the work of the United States corresponds the prelational control card hands has been correspond to the reclassation of card hands has been

Throughout the year the work of the United States provinces in the voluntiation of orfel lands has neversinest in the evoluntation of orfel lands has exercised on with gratifying results. This work one sample on the United Process of the Western, Middle and Southwestern States. By the end of next rail to describe the term of the Process of the Proce

which has been driven through the mountain and in now being used to divert the Ginnison River litte the furtile Uncommission Valley

Now being used to direct the Gunzinea River light his facility Disconsignary Valley. The hervision total of the solid rook of Manistana Binand the needed space for two of the kurpect rathway terminal stations in existence, and building within and upon them adequate texts speed and terminal accommodation has proceeded space during the past year. The Pennsylvania Terminal is practically completed as are also the connecting time-file with New Aersey and Long Island. The present ness with New Jersey and Long Island. The present indications are that this great work will be through open for public use early in the summer of this year. The work of excavation which had been temporarily all but suspended on the New York Central Terminal all but suspended on the New York Contral Terminals has been proceeded with such yield entire [1996] that all but two tracks of the old train shed have been removed and the root excavated to about 65 feet below the street level. It is greatly to the credit of the moved of the street level. It is greatly to the credit of the first terminal transfer of the contract tracks and the contract tracks are contracted to the contract tracks and In its satiraty the downtown tanaels from Jersey CHIV. Octoband Steech saving been put in service during the year. A franchise has been granted to the company for an important extension from Sitch Avenue and Sird Street to the Grand Central Station. This important connection will enable passengers from New Engiand to the South and West to travel by rail from the Grand Central Station to the Grand Central Station to the creak thes terminal station to the trank line terminal

the Grand Contral Station to the trunk line terminal stations in Jerry City

The close of the year witnesses the practical complex close of the year witnesses the practical complex close of the Manhatan Suspansed by four out of the State River which is now spansed by four out of the State River which is now spansed by four out of the State the contable Forth Bridges in Scotland The Manhatan Fridge which is of the suspansen type has the large set carrying capacity of any inriges in the world provision being made for four rapids in task in the state of the bridge protonuced this great attracture to be bridge protonuced this great attracture to be the bridge pronounced this great structure to be thoroughly adequate to carry the loads imposed. The structural modifications recommended by the commis-sion which investigated the Queensbore Cantilever sion which investigated the Queensbore Cantilever Fridge over the Bank River with a view to decreasing the total dead and live load have been made and this structure also may be reparted as perfectly asks for the modified leading adopted. The commission of angineers which have the re-designing of the Quebec Bridge in hand are still at work upon the plane and orage in mass are still at work upon the plans can ar yet no statement has been made either as to the character or capacity of the new hridge although we understand that there is a possibility of the suspen sion type being adopted in preference to the canti-lever—a wise substitution

Naval and Military.

lever—a wise substitution.

Neval and Hilliary.

Progress curing the past year in maintern savel and military may also an interest of the past year in maintern savel and military may be added to the past year in maintern savel and military may be an expected of the among which are the South Carolina and Michigan the first all highen battleships of our navy. These vessels which are of 1500 tons displacement carry-sech such that the limitation of the residual trial maintained an average speed of 187 knots. The Dolaware and North Dakota drawfacospits of 800 tons displacement carrying each test Handelson and the North Dakota drawfacospits of the past of the past

5

Scientific American

year the histor had an opportunity to make a 20-mile trip in one of these vessels, and he can testify to the remarkable case and accuracy with which the craft savered. Unquestionably submarine warfare at come into its own, and is destined to be a has at last come into its own, and is destined to be a potent influence in deciding the issue of future naval operations. Lattice masts have been fitted to all of operations. Lattice masts have been fitted to all of our battisships, and, as aftereding a five control plaintent, they have proved a decided success. The guinery of our navy continues to maintain its high excelence, and our shooting in betieved to be new second to note as the world. Mention should be made of a greatly improved British torpedo, which has a dismerter of \$1 inches and is evedited with a need of the Robin series of the state of the series and is evedited with a need of the haltship has a raised the question of increasing size of haltships has raised the question of increasing size size and draft of drydocks—a most serious consideration. During the wars a contract was left for the laws. tion. During the year a contract was let for the large drydook at Pearl Harbor, Hawali, and a new contract has also been let for the hig drydook at the Brooklyn navy yard, New York. At the present time only o largest drydocks could float the new "Wyoming" ov the sill at high water, and then with but a slight mar gin to spare

gin to spars.

The new 1-24ndh 50-caliber type gun, of the kind which is to be mousted in our \$8,000-ton ships, has shown, in the Proving Ground test, an initial valoeity of 3,000 feet per second and a mussle energy of \$5,000 feet per second and a mussle energy of \$5,000 feet per second ground in power will be the new 1-4-inch navy gun, recently completed at the Midrais works, which will fire a 1400-pound projecties with a mussle energy of 65,000 feet. The new army 1-4-inch groun will be less powerful, but it as courage, life will gun will be less powerful, but it as accurage, life will gun will be less powerful, but its accuracy life will be greater It will be capable of fring 250 rounds, as against 80 to 100 rounds which is the limit for the present high velocity 154-nch army gun. A compari-son of the sea strongth of the powers at the close of the past year places Great Britain first, the United States second, Germany third, France fourth, and Japan fifth When all ships now building are completed, Germany will be second with 250,625 tons, and the Duiled States third with 126,437 tons displacement. In dreadcoughts in stands first with seven completed, and nine building. Germany second with two compl nine building, dermany second with two completes, and nine building, and the United States third with two completed, and four under construction of pre-dreadmought battleships carrying guns of 11 inch caliber or over, Great Britain has forty nine, the United States, twenty-five, and Germany, fourteen.

Marchant Marine

The deplorable decadence of our merchant marine as continued throughout the year, and we look in has continued throughout the year, and we look in vain for any adequate evidence of the awakening of the nation to the seriousness of this pre-eminently na-tional question. As a measure of security and defense, tional question. As a measure of security and defense, the existence of an adequate number of merchan these them are as transports and colliers in time of war is vital to the efficiency of our narry. Although, during the world cruise of our feet, the world hooked on ap-provingly and applicated this evidence of mercil a strength, the people who know—the naval boards of strategy that award officers in general—most strategy and award officers in general—most sur-turangers and colliers, a veyage of this charmed, and transports and colliers, a veyage of this charmed would never be errously contemplated by our naval board, and certainly never alternoted. The signature would never be exclusive to a surboard, and certainly never attempted. The signs of decadence of our merchant marine are so clearly writ-ten that he who runs may read. Within two years the number of American steamers crossing the Pac-and capable of carrying the mails has been reducmore than one-half. The year before last the Post Office Department recommended, and the Senate Office Department recommended, and the Senate operand a bill providing for a compensation of so much per salle to steamers running to South America, the Philippines, Agana, China, and Australia, but the measure fulfed to become law. It is certain that without mach indeed accouragement American steamable likes will mere to established, and multi the construction of mail solutions on an account of the contract of the fee

e defense of its own ports. The past year will be notable in the annals of t the details of its own ports.

substitution of four-bladed propellers of amailer diam-eter for three-bladed propellers on the outer shafts of the Cunarders has not only completely eliminated what vibration there was, but by improving propeller what threation tarre was, but by improving proposes officiency has considerably increased the speed. There is no orticence that any company will ettempt to rival these vessels in speed, and probably tuture develop-ment will be along the lines of the "Olymptic" and "Titante". These moderatorspeed vessels are to be driven by a combination of reciprocating engine and turbines, the reciprocating element being used in the uranues, the reciprocating element being used in the higher ranges of expansion, in which it is more eco-nomical than the turbine. In a recent trip to Now Zealand a merchant vessel, the "Otaki," fitted with neglines and turbines, made the same average opeed as the sister ships "Orari" and "Opawa," fitted with cating engines alone. Her coal consum was 11 per cent less, and there was a reduction of 20 per cent in the water consumption, all three ships having the same boiler installation. In this combination, when reversing, the turbine is cut out and the reciprosaling engines are connected directly to the reciprossing augines are connected directly to the condensar Toward the close of the year two infer-esting devices, designed to reconcile the slow-speed demands of the propeller with the high-speed demands of the turbins, were made public. One, designed by Admirst Meville and Mr Medajins, consists of a re-duction gear of the helical type interposed between the turbins and propeller adalt. The other, designed by a German engineer, employs a form of byfausilic turbins are subjectly than the control of turbins of turbins reasonables, in which the ratio of turbins turbine transmission, in which the ratio of turbine speed to propeller speed can be rapicel indepiler. For both devices a high efficiency rate in claimed. The Curits turbine, because of its large diameter, and con-paratively low speed of revolution, has iess trouble from propalier indeficiency than the Parsons type. The loss of the "Bapublic" early in the year gave dra-matic evidence of the values of wireless tolegraphy as and a composite entry in the year gare driven the control of the value of value o pagestic material entered She was built for the Car-negle Institution at Washington, and her surveys of the ocean will form part of a comprehensive survey of the ocean will form part of a comprehensive survey of the value would be considered to the companion of the exact local magnetic variations of the companion of the exact local magnetic variations of the companion in the "Monitoria," whose built is built with large cor-ragations, the object of which is to increasant her long-tudinal atrength of the ship, without increasing the weight. The ottra cost is slight, and the carryin capacity is said to be increased from three to four per cest.

The most surprising fact in railroad development during 1969 was the continued and very considerable increase in the one of passenger and freight incomes in the one of passenger and freight incomes to be a marking of late about the 'llmin of size having been surely rached.' The adoption of the Meilet articulated system has made this increase possible three incomes of the contraction of the foundation of the foundation of the foundation of the contraction. A freight commotive for the Monntain Division of the Scale Sca way a still larger locomotive, with 6,631 square feet of heating surface and 1,163 square feet of superbesting and reheating surface, the engine alone weight SII tons, and the engine and tender together 350 tons. The most novel and important departure in the new passenger engines of the year is a huge Mailet if-wheel iconomitys, with two high-pressure 3-fainch cyl-inders driving six coupled 13-inch wheels, and two \$Hinch low-pressure strindare deviate freeinders diviting six coupled Thench wheals, and two hinch low-pressure cytificate stiving four coupled Ti-hanh low-pressure cytificate stiving four coupled Ti-hanh wheals. The total heating surface is 475 enume feet, and there are \$1,111 enumer feet of superheating and reflecting surface. The engine weight 138 tons. Such an engine will be shie to hard the exceedingly heavy American express trains at a rate of speed equal to that of the lighter European trains the quality of steel ratio darlowed from the rati mills. Reports of the Parkle Service Commission will be a surface of 1974 therefore \$1.00 to \$1.00 t

It is encouraging, also, to note a decrease in the number of railway accidents. This is due to nome measure to the increasing application of the block signaling system, which now, except for a few short distance totaling about 100 miles, extends subrotes from the Allantic to the Pacific counts. Oreat activity is also being displayed in the development of actions forms of automatic signaling, and particularly of that class of devices which acts directly on the train, and presents some virsus or activities and presents some virsus or activities of the control of the contr latest, and as far as experimental tests go the most promising, is the Brennan gyrostatic railway, which is receiving support in Europe, notably from the offi-cials of the British ermy. The little experimental car exhibited in the spring of 1907 has been followed by a exhibited in the spring of 1907 has been followed by a full-sized car, weighing 32 tons and carrying a load of 40 passengers, which has made successful trips on an experimental track. The present indications are that the system may find useful application on light railways, acting as feeders to the main steam or elec-

omy, Photography, and Chemistry.

Astronomy, Phetography, and Chemistry.
The year 1909 is astronomically memorable for the return of Halleys famous comet. On September 11th last, Dr Max Wolf of Hefdelberg discovered this Aiscorle wanderer upon one of his photographic plates in almost the exact position which the calculations of Cowell and Crommelin called for—a feat which may be regarded as a triumph of mathematical astron The comet will pass perihelion on April 20th, The comet will pass perihetion on April 20th, and will be a compicuous object in the western heavem efter sunset about the middle of May, at which time the earth will pass through a portion of the comet's tail, and the comet itself will cross the suns disk. The reappearance is therefore of exceptional interest. because it will give astronomers en opportunity of obtaining much valuable information as to the comet's

structure. The year was further signalized by the discovery of another comet by Mr. Daniel of the Princeton Observatory—the third he now has to his crofit.

On Septamber 24th, 1909, an opposition of Marzo coursed—the most favorable which astronomer and possibly have for another fifteen years on that date he planet was distant 3,5,000 miles. Nature the planet was distant 3,5,000 miles. Nature the planet was found to the planet was foun Prof Pickering, in order to settle it once and for proposed a method of signeting by mirrors, and I proposed a method of signeling by mirrors, and rrow Wood of Johns Hopkins University suggested a method of "winking" by means of black cloths on reels Neither astronomer probably believes in in-telligent life on Mars, but was actuated solely by a desire to close a wearlsome, perennial debate. The theory of hebitability depends very largely upon the presence of water on Mars. Dr Campbell, director of presence of water on Mars. Dr. Campbell, director of the Likt Observatory, made a carrial comparison last year of the spectra of the moon and Mars. He found to the spectra of the moon and Mars. He found to the spectra of the moon and Mars. We will take the spectra of the spec elive than ever

There were two exitoses of the Bun and two of the The lunar erlipses were both total and oc-ed on June 3rd and November 26th. The eclipses of the Sun, occurring on June 27th and December 12th, were respectively central and partial.

As might be expected, the radio-active elements still

Jan. were respectively ventral tain proteinments still and mainly be expected, the redirection of the cohemita. Although during the year 1509 no very demonstratements elimportant announcements. Sir William Ramsay sealed up some radium brondled in a bottle toesther with water, and observed the regular evolution of the gas (hydrogha and oxygen) at the rate of 30 cube centimeters per week. After nine months this evolution ceased simoet entirely from which Sir William Ramsay concluded that either the radium real their loss observed from which Sir William Ramsay concluded that either the radium real their loss observed from decomposing the water. This contribution is a second of the second of the second of the composing the surface of the contribution of the second o in separate giass vessels. Whichever chemist niti-mately proves to be right, the investigation is interest-ing, because it is the first attempt to apply practically the ecorroous store of energy which is contained in radium and which may be gazed when it is starded that, during distintegration, radium emits two and one-half million times as much host as an equal volume of hydrogen and oxygen combining explasively to form water. The work of Soddy for 1809 has shown

Scientific American

OXTORY AND RUMAN SHEDGY.

Oxygen is the life-maintaining gas it is the most useful and the most abundant of all the elements as we still call them its combination with other substance—oxidation makes heat and that is why the sentient body is so nerally warmer than the atmos phere about it Ali animal and vegetable life depend

t pon oxygen under the suns benignant influence plants give out this gas which thus freed is respired in animal life And by the term respiration in the physiological sense we mean not only the series of acts known as hreathing i ut also that in respiration exy gen is carried from the lungs by the blood. through the minutest capillaries to the ut termost cells and the most microscopic tissuce of the body giving to it strength and warmth and life

warmth and life
In point of fact life itself in our present
knowledge is intone lyable without oxygen,
which is much more important than food to
the human economy Wilhout the latter
one may exist for months without the for
mer one must die within a few minutes
(onsider size meshabilam Normal metabo-(consider also metabolism Normal metabo-lism is the port c themical transformation of oxygen fluids and food stuffs into healthy tissues. The process is a news rest ing an ever changing one Respiration pro-vides the oxygen inguestion provides the fluids and the food stuffs. And in that in shilts y complex inhoratory the animal body these substances are combined in the con signt manufacture of frosh cells and tissues sunt manufacture of frosh cells and disames to take the place of those whi h are as con stantly dying and being removed by way of the lungs (arbon dioxide and watery vapor) and the ex retory organs

We are thus able to at pre late one of the most valuable dicia of the exciutionists that normal living is the right adjustment of rnal relations to external relations again whatever an cunt of nower an organ ists experds in any shape is the corre and equivalent of a power that was taken in from without in our physical life—as absolutely dependent upon a wholesome en vironment for wholesome existence and by far the most essential and the most benefit element which our environment afford

cent element which our environment amoreas ms is express it is here very important to note that nature does not voutsasfe us this express pure as has iempreed it for our use by combining about one jart of it with about four parts of nitrogen (an inert component) Oxygen pure is irritating and (an inert component) (Azygen jure is ifficiating and came a form of oxygen in which there atoms are considered to be (and/need into two—has in experi ments been found so caustic as to produce pulmonary in thanmations. The safest and the only good and right form of oxygen inhalation for normal restures right form of oxygen inhalation for normal restures is in ombination as it exists in the stroophers for this is the form to which during many ages the race has become adaptid it is possible that in other some creatures respired oxygen under a different combina tion than that which now obtains but in those group there were no himan beings—only such creatures as ichthyosauri and the dodo No we can live most ad vantageously most wholes mely and with the best

human results only in conformity with natural laws as no find them, and with due respect and regard to our environment

There are however abnormal states of the human body in which oxygenation is deficient by reason of disease processes and in these diseases it is sought to administer oxygen in greater proportion than obtains in the ordinary atmos phere We give it thus when oxy g nation of the blood is interfored with as in dyspnora emphysems asthn a croup whooping ough as-physia tuberculosis and pneumoinyma theerculosis and pastumo-nia and when the oxygen propor-tion in the bicod is poor as in ane mia diabetes and chlorosis (the greet at kness) Here Hayems find inga are 1 b lieve a sthoritative in such diseases as those just men ilaned oryg n mir d with a deter-minal quantity of air energises to a considerable legree the nutettive increases the appetite slightly elevates the temperature stimulates the cardiac movements and augments the bodily weight the number of red blood cells is in creased and their organic activity

is not constant, the effects may become so greater nutritive changes that are thus promot Observe now the portion of Hayens statemen I have italicised. In point of fact even in dis-Observe how the portion of Hayesin a statement which I have italized. In point of fact even in disease we do not as we could not, administer crygen pure, more-over the nume in administering helds the tabe in such manner between the parted lips that some admirture of air takes places this admirture is essential if the oxygen is to be respired at all Nor have I. for my

TOTAL BANUS GEA HISTO

part been always sure of the efficacy of oxygen in such diseases as pneumonia. I have felt that pure at mospheri alr—the colder the better its tunic proper ties—has been as efficacious as oxygen in cases us or events. Some physicians indeed go so far as to de-clare that the appearance of the oxygen tank connotes the about the connotes the source of the oxygen tank connotes

the beginning of the end for the unfortunate patient Nor does the express tank supplied for use in the sick room contain pure exyren. One of the firms which supplies this gas for the sick room informs me that their pureed exyren so per cent the remainder being nitrogen that in half the cases physicians preoring introgen matter must be made payacians pre-fer and call for tanks containing exygen compound which is made up of 60 per cent oxygen 20 per cent nitrous oxide (laughing gas) and 10 per cent nitrogen I find it now very exycopos to present certain physic-

I find it now very apropos to present (Concluded on page 16)

when the bedy unknowns to under the success groups by which the bedy unknowns to upped favording misropies, the 1dee was suggested to effect artificiality a local in crease in the temperature of those pants of the bedy which are unbested by dimeso, thus assisting of the human

In the temperature of these made of the body or embedded by disms, these satisfies the humans in the fact rangels against the merital process in a stillable medicals against the merid process in a satisfied has the supply is elicitated by the finalizer medicals of the familiar medicals of transmit which have seen in the form time immensionful. However, there was no far no possibility of seatily permeasing the hody with heat, any effects body and the second seat of heat through evaporation.

The process described in the following paragraphs fallow any part of the body to be organized.

Barricelli, Friese-Greene, and Urban and Smith. —Barricelli, Fries-Greene, and Urban and Smith. Curiously songs, all three investions are based upon the same principle of so rayidly presenting images and the property of the property of the property combined that the property presentations, and therefore combines them into one picture. In the same field of chronophotography must be mentioned the in-pertant application of the moving picture machine to the ultra microscope by Dr. Commandes, as applications. somewhat similar in principle to the combination of the ordinary microscope and kinetoscope made by Dr the ordinery microscope and kinetoscope made by Dr Robert E Weskins of this city over ten years ago Comandon's invention promises to be of considerable educational value in actually enabling us to see the struggles of our blood corpuscies with their microbic

struggines of our most corputers with cateral anticonsensities.

Electrical.

In view of the great advance in its officiency, the imparts lamp is entitled to be counsidered the most notable improvement of the year in the fatel of electrical ymentum and the mass however of the imparts high resultances that the product is being and in successful one from the air, which is being so successfully superior that the product is being sold in successful one partition with the supply from thill. Also the soldent expansation for fitting process, hitherto in the experience of the supply of the product is the product in the product is the commercially practical arther to the experience of the product of the product of the product is the product of the product graphic plate in hichromated goldtin presents a series of elevations and depressions, advantage of which is taken for producing, by a tracing polat, ceriliating measurement, and fluctuations in the transmission current. De Forest has improved on his system of wire-less telephops as used upon our battlenship during the world cruise, and a number of stations have been part in operation on the Great Lakes for communication. in operation on the Great Lakes for communication with steamships. Communication has been established ever the ninety miles separating Chicago from Milwaukoe, and steamers have been in touch with the shore from a distance of forty five miles. Gabet in short from a distance of forty five miles. Gabet in France has arbitred some success in the steering of a \$10 foot torpede by the wireless method previously steed by Twels to this country and Armstrong in Nacland. The torpede is driven by an internal-combinition motor, and immediately back of the explosive head is a compartment containing the wireless-controlled instruments. It is claimed that the control is effective up to five or air miles. The control is offered to the control is offered to the control is effective up to five or air miles. It is due to the control is effective up to five or air miles at all the redder was successfully operated from a small boot at editance of a little over 100 years. Mention should also be made of experimental wireless communication with a bulloon, made by the United States Army Signal Corps by means of a 100-100 chapshar-brown gard. with a balloon, made by the United States Army Signal Corps by mean of a 100-foot phospher-brones wire superacide below a balloon 1,000 free in the air Communication was kept up from the Washington station until the balloon was about all milled distant, and messages were received from Annapoles over distance of from twenty to ten miles

The spillculum of electric fraction to steam relationship to the communication of the control of the c

are apparention or electric traction to steam rati-reads continues to show gratifying results. Although no figures have been made public as to its economy, the electrical operation of the suburban tracks and terminals of the New York Central and New Haven lines has been carried on throughout the year with un-hroken success. The New York Central electric sone is being extended to White Plains, and the New Haven Company are hullding a mile of experimental over-head line beyond Stamford, preparatory to the extension of the system to New Haven The latter com-pany have else ordered two experimental freight loco pany have also ordered two experimental rivight loom mittee, and it is the intention to operate the whole the from New York to New Haven, a distance of nearly eighty miles, with electric traction both, for rivight and passenger service. The Frameyimiah Radio manufacture of the service of the properties of their tunnals and terminals in New York city. An impor-nant improvement in three engines is the removal of the motor from the axis and placing it above the frame, with a view to raising the center of gravity and reducing the stresses on the track and roadbell. Since the properties of the service of the properties of the pent of the raisedty of central power stations by the tion should be made here of a most important enlarge-ment of the capacity of central power stations by the introduction of low-presence turbines between the low-pressure cylinders and the condensers, in such power stations as are now operated by reciprocuting easilies. In the 56th firred power station of the New York sub-ways the maximum output of 5000 Microstral or the big cross-compound eaglisse has been increased to

16,000 kilowatts by interposing a Curtis turbine in

Great as was the advance made in sevenantics design 1969, it was far surpassed by the extraordinary developments of the part year, and when the history of this new act comes to be written, the senantical performances at the Rheims made, and anheavemently, will be reterred to as marking the era of practical and thoroughly controlled human flight with the heavier-thaneity machine. On July 20th, Gwrille Wright comthe contract of the contract process of the contract machine. On July 50th, Owille Wright completed the government tests at Fort layer by Sving the contract process of the process of the Here the public witnessed the astonishing sight of as-many as half e dozen seroplanes in the air at one time, the plots of which showed perfect control of their ma-chines in the gusty winds that prevailed Both Bleriot and Curtiss proved how near the acroplanes had come to reaching the 50-milean-hour mark, the former winand Curties proved how near the aeroplase had come to reaching the Schmiles-how rant, the former winning the \$11-mile race at a speed of \$47.78 mlbs per hour, and Curties bringing home to America the later-national Cup by covering 13.42 mlbs at a speed of \$47.01 miles per hour That the seropiane possesses endurance as well as speed was proved by Farman, who wen the long-distance race with a record of 111.88 miles covered in 3 hours, 4 minutes, 55.76 seconds, who went the long-distance race with a record of 111.81 miles covered in 3 hours, 4 minutes, 55.76 seconds, 111.81 miles overed in 5 hours, 4 minutes, 55.76 seconds, 111.81 miles of the meet, Farman, on Novamber Bri. et al. Morradon, 111.81 miles and 52 seconds, and alone, at the present writing, there is no indication that the Wights will make as affect to restain the cup; in must perforce be retarned to France During the Holdoof Fullow Celebration in New York, Wilbur Wright proved his faith in the reliability of his machino by fright from Governor's laised up the Hudson River to Great's Tomb and back again. Barly in October Orville Wright has as the hours, and the hudson form of the second from Juviany to Paris and back, a distance of 30 miles during which he flow shore the Bills during which he flow shore the Bills during which he flow shore the Bills during which he flow shore the property of flett, is the increased assertance with which aviation are now making their flights under unfavorable wester conditions instances of this occurred both at the Rhelma and at the Hackpool meets, when takana passed successfully through heavy thoused equalits and also drove the machine around a closed circuit in the time of a wind which was heavy snough at times to bring him aimout to a standerill. That is the property of the standard of the sta

the enterestril exceptant. In the order of the control of the cont

wann ton green currons so need tone at them.

The automobile has risked such a stage of parties that the record of improvement is confined eitherly to matters of selell—so striking novelikes have been developed surjug the year. The high-pend out is now boilt abnow toolselvedy for putting purposes.

For tearing, a limit of the 10 No paraphyrers to legislate to most the requirements of the recomp procleme, and the control of ST. La Adrich of International Marks Bactisevine, who equipped a éfoice box vita 8.45-one-power expitates producer-gas engine. Extensive cruising during the past summer prevent that the boat can cover ever 800 miles at an average speed of 8 to 8 miles at an average speed of 8 to 8 miles at an average speed of 8 to 8 miles at an average speed of 8 to 8 miles as about no one to an of past authoritic coal—a truly remarks perform on the two or three years ago, sense destined to remain what it has always been, as accordingly interesting currently. As a more it has aboven high speed, but not sufficient to enable it to win against the high-covered beat of standard struction. The factor to the control of the c gines, which won the principal race at Mousco last year over a 6214 mile course at an average speed of 3915 miles per hour

On New Yards are the American Motor Chr. Manschotzwer Amendation will open its annual authorships and the American American State of the New York city. This show of the American State of the York city. This show of the "millouned" manufacturers will last swelt. There are 386 ethilitors, and the total vable of the athibits in in the neighborhood of \$1,100,000. Nearly 100 ethilitors of computer vehicles have space, while the exhibitors of approximation are more namewore than every before.

The Licensed association of automatic Manufacturers will had rather touch manual show in Madison Spaces (action from January Ith to English Spaces and Spaces (action from January Ith to English Spaces) and the state of the Spaces of the Spac

Scientific American

After leavants how to fix a Curricus biplace and making syswal excellent sights at Hammondsport, N. Y., the Longact of which lasted is finantee, Charles K. Ennglison made some dering slights at H. Joseph, Mo. Perentry, as detailed below by our correspondent. The machine he is using in the same one that Mr. Ourties and at Generator's Island, New York, when the stemples to fiy there during the Hudson-Pulton celebrate. Tries after with a Mr. Landsche and the Contract of the Co tempted to fly there during the Husson-Fution cassors-tion. It is fitted with a Si-horse-power 4-cylinder water-cooled motor, and the planes have a 30-foot spread. The machine weighs some 500 pounds. The first flight at St. Joseph was made on Sunday,

mber 12th, over a circular course above the from December 18th, over a circular course above the frozons surface of Lake Contrary. After two straightaway flights of a half kilometer against the wind and a kilomester with the wind in order to test the motor, the hiphane ascended in a move storm so intense as to be hindring to the spectators. The velocity of the wind exceeded 30 miles per hour A stimona height of 40 feet was mathetained throughout the one and a of 46 feet was maintained throughout the one and a half times around the course—few miles—except when nearing the Casino, a summer opers home that just out into the lake. This forms the "serojane grave-yard" of the course. On Tuesday, December 14th, a trial in the field inside the race track was made velocity, a fast vas made over 100 miles an hour estimated velocity, a fast vas made over 100, mow, and weeds of the tafield. The machine got of the ground under these adverse conditions, but made a 100-foot flight only. A new outroverter had been put on the engins and a +böded propelier shedlitted for the 3-bådded a vosace propeller substituted for the 3-binded one. A bad spark ping gave trouble throughout the day. Later the machine was wheeled to the lake, and a start made from the ice. The aviator feared the demolishment of the meahing. a start made from the los. The aviator feared the demollshment of the machine, and hald close to the surface A plercing northwest wind swept the los, and during the two flights a speed of 32 mines per hour was made with the wind while firing near the west show: The thining was done by Mr. J. H. Hees, and the distance was measured by your corre-

spondent. Wednesday was a day of failure, owing to motor truthle and unfavorable winds, until a late hear in the affarmon, when two trials were made over the faild within the race track. The first was a very short flight, and the second resulted in bresking two support braces of the borisontal rudder. The manager of the flight appointed by the Restall Merchanta' Associated in the first series of the flight spontage of the flight spontage that the Restall Merchanta' Associated the ciation insisted that the starts be made from the field within the race track. This was an undulating surred with ice and snow, and only 1,250 fe

long.

On Thursday, after the Shinded propeller had been repinced and the old carbureter reinstalled, the machine was taken to the lake once more A stiff north west gate to the lake once more A stiff north west gate delayed situate until late in the afternoon Two flights, or rather a sories of short flights, were row flights, or rather a sories of short flights, were namerous tosoches. Only three cylinders were first part of the time, and at these intervals the machine touched the fee. The motor finally failed stingether, and the machine touched the fee. The motor finally failed discaption, and the machine was stopped so auddedly by the suplication of the brakes that it added completely around on the ite. This resulted in treaking the example of the contraction of the state of the contraction of the state of the contraction missing, and while passing through motor started missing, and while passing through ow drift two tires were thrown, locking one wheel, but notwithstanding this, the machine again rose and covered 1,000 feet. The motor picked up in the mean-time. Altogether, some remarkable feats were accom-

philabed. The flight on Sunday, December 18th, was discontinued owing to inability to see, the fast-falling move having formed for upon the stateo's geogrics. This flight was made in private, and was not witnessed by many people. Somether 18th avisiter Hamilton made On Sunday, December 18th a visiter Hamilton made have flight at 8th Joseph. He circled abover Lake Conterns for tweet minsten. The flight was witnessed by 600 interested speciators

Correspondence.

To the Editor of the SCHENIFIC AMERICA."

To the Editor of the SCHENIFIC AMERICAN
Following closely on the heels of the article in the
SCHENIFIC AMERICAN giving the new U S. battleship Scientific Assistant giving the new U R. battleship 'North Dakota' the proved title of 'Pastest Dread-nought Afford,' there appears in the columns of a Canadian publication of the first class a statement to the effect that British 'Dreadnoughts' are known to make an average of over 28 knots an hour, while the maximum average made by the 'North Dakota' is below 28 knots an bour 'I'll the exact Aquere relating to Great British's naval

If the exact figures relating to Great Britain's naval affairs are not very generally known, may it not be that she, perhaps more wisely, prefers not to publish to the world her naval socrets, while Americans, in justifiable pride over their arbievements, are making ill-advised haste to claim the first place in the prog ill-advised haste to claim the first place in the prog-reas of naval science. We have a right to expect the perfection of accuracy in all matters treated of in the pages of the SCHENTIFIC AMERICAN M W Stanstead, Queboc.

[The "Dreadnoughts" referred to as making over 23 knots are probably the cruiser-Dreadnoughts of the "Invincible" type The "North Dakots" is of another

EFFECT OF BARTE'S ROTATION ON STRONGOPIO GARA To the Editor of the SCENTING AMERICAN I take much pleasure in reading your paper, and be-ing a railroad man, was especially interested in the

ing a rairroad man, was especially interested in the article describing the monorali car I have seen the gyroscope principle, for balancing such a car, dis-cussed numerous times, but there is one point regard ing gyroscopes which I have never seen mentioned in connection with this scheme.

It may not be of much importance, but It is neve It may not be of much importance, but it is never-theless interesting, to note that a gyrescope does not retain its balance relative to the earth, but relative to a fixed point in space In other words, it would appear that on a "mono-railroad" running north and south a car would be tilted to the west at the rate of fifteen degrees per hour, or one degree every four minutes, due to the rotation of the earth Of course, this is not fast enough to inconvenience

anything, and perhaps Mr Brennan has provided a way to overcome this difficulty, but if not, it would be interesting to hear what others have to say in regard to this.

At any rate, a solution of this problem would be have interesting and of more practical benefit than At any rate, a solution of this problem would be more interesting and of more practical bonefit than the computation of our ancestors. For the monorali appears like a great improvement over the double-rail system for economical and rapid transportation. In system for economical and rapin transportation in fact, for light, high-speed passenger and express traffic, it would seem as if there is a great future in store for the monorali.

1. Lockwood, Ohio.

face by well-driving machinery This would allow an air, food, and water supply to be maintained indefi-nitely, whether or not it should be necessary to seal nitely, whether or not it should be necessary to seal the mine for the purpose of extinguishing fires Of course, it would be necessary to equip each of these stations with telephone and possibly lighting facili-ties, and of course, with facilities for forcing air into of the pipes

one of the pipes.

I am assuming, without having made figures on the proposition, that sufficient air to supply a considerable number of men could be forced through a include in the country of the country that is considered to the country that is constant to the country that is constant as the country that is constant which would prevent such appalling caismittes as the recent one at Cherry, Ill., and with this or some similar plant be contry to be so slight that it would be precioable to carry the means into effect. The bown Syracuse, N. Y

RESIDENCE SHAFTS FOR MINES.

TO the Billior of the Strature Ora REITS.

To the Billior of the Strature Agency and as a further safety procusion in the operation of mines, I would suggest the drilling of harpe holes, as many as may be accessary, from the surface to the main arteries of the workings, up through which, in cases of diseaser such as the recent one at Cherry, Illies could be frawn to safety. Seventeon-index holes are new quite common in the oil country, and larger scane could, be child it necessary. These holes could

be located at different advantageous points, and terminate in rooms in the mines or alcoves cut at the sides of entries in such a location as to not interfere with their daily use Silings made of chains, four chains, 80 feet long, spaced equally around a circle the size of the hole, and attached to an iron ring or use sue or the hote, and attached to an irus ring or apider at their upper ends, five small circular plat forms of strong wire mesh, spaced six feet apart, in alde these chains, would make what could be termed a five-storied elevator cage that would hauf dive men

a nvestoried sevator cage that would have now men or ten boys pp at a trip.

Such a cage could be galvanized for durability, would be strong, and not weigh over 150 pounds.

There could be handholds placed under each platform for tha men to grasp to steady themselves. These cages would collapse when they would strike the bot-tom and could be quickly leaded, a man stepping on to each platform as it would be slowly raised, and ed, could be quickly holsted to the surfis A perhaps better cage could be made of strong wire mesh platforms and all intr would have to be made to descend into a sump drilled deeper than the bot-tom of the mine, so that it could be loaded as it was

The holsting drum on the surface could be operated The holsting frum on the surface could be operated by steam, air, scientic, or own home power The latter would have been invaluable at Cherry, Ill., as thare would have been ample time for even a alow-operating apparatus to have saved all able to get to it, but an electrically-driven holster would be preferable to any other Wires from the power house could be run to each holster, and proper inapaction would master the apparatus to be in working order, if it stands the medium. should be needed

should be needed

Air could be hlown down these hotes for the supply
of the men at the bottom, even if the cages were being
used, the wire mesh construction of them allowing its
passagn Water, food, oil for light, etc, could be sent
down through the holes, and even doctors with medi

cines
The holes could be left open at all times for ventilation, but if such would interfere with the working

I can see no reason why this plan of rescue in co of mine disasters would not be entirely practicable and effective, even in mines of one thousand or more Indiana, Pa.

The Current Supplement.

An illustrated description of the large double-devided with his above constructed over the Brite Wear to accommodate both rulerost and highrest families in building the commodate both rulerost and highrest families and the state of an article which will undombedly be read with interest by amateur mechanics. Up to a few years gow water powers were easily bought for a song Nowadays they have so definite a vatue that the matter of ascertaining brite ractual horse-power in of considerable importance Mr W T Hyna explains how this excitation is made Robert M Strong's restricted to comparison of gasoline and atcohol engines is continued. The connet families of Saturn Uranus and Neptune are discussed by H C Wilson. L H Backeland describes the use of his newly invented substance. Subscribes the use of his newly invented substance. An illustrated description of the large double-deck s the use of his newly invented substance scribes the use of his newly invested substance base-like for electrical and chemical purposes. The kineto-scope has whered a new field. It now shows us moving pictures of a world which is invisible to the naked eye and revealed only by the ultra microscope, all of which is explained in the current Supplement James Scott writes on microscopic tree fungi. The efficiency of modern aeroplanes is discussed by G Garnier on the basis of the results obtained at Rheims.

A Correction

In an article on page 462 of the Scientific American December 18th, 1909 it is stated that by the interof December 18th, 1909 It is stated that by the linterposition or a turble between the low-pressure cyclic prosection of a turble between the low-pressure cycli-ders and the condenser of the cross-compound recipro-cating surfaces in the 59th Street power station and dittional 8,000 horse-power was secured. The less should have rad an additional 8,000 kilowatts. The maximum economical output of these onetime is now \$0.00 kilowatts desciped in the reciprocating element and an additional 8,000 kilowatts in the turbuse makof D ing a total of 16,000 kilowatts or say about 22,000 horses power for the whole engine

The Municipal Art Commission of New York has just published a catalogue of the works of art belonging to the city of New York it is a book of 240 pages, and contains more than 100 lituarations reproducing the works of art scattered around the city

THE RESPONDING STREET, OF TAXABLES

the present state of science, the solution of the sm of vision at a distance by means of electrical mission appears to be only a question of money rebes in this field are directed toward the utiliza-Researches in this field are directed toward the utilization of a poscular property of the element selantum, which conducts electricity more or less readily in properties to the intensity of the light which falls upon it by the property is based the system of electrical Upon this property is nessed the system of esectrical transmission of photographs which was invented by Proc. Korn, of Munich, and which has for several months been in regular operation between the offices of the Dally Mirror in London and L Illustration in Paris The general arrangement of Korn's apparatus has already been described

in the Schwiffer August be transmitted a negative film, is wrapped round a cylinder which is caused to rotate before a source of light so arranged that only a very small area of the photograph is illumi nated at a time. The pen nated at a time rine pen

A oil of light after traversing the film falls npon a
cell of selenium forming
part of an electrical cir
cuit which extends to the receiving station

cult which extends to the receiving station Owing to the property of estentum mentioned above the cur-rent which flows through this selection coil at any untant is proportional to the transparency of the nega-tive flim at the point traversed by the pectl of light at that instant. At the receiving station this flutu-ating current is employed to uncover to an extent proportional to the instantaneous strength of the curproportional to the instantaneous strength of the cur-rent a lane which conveys a beam of light upon a photographic film carried by a cylinder which rotates in synchroniam with the cylinder at the iransmitting station. Hence the part of the film on which the beam falls is illuminated and consequently blackened to a degree proportional to the transparency of the corresponding part of the original film. In short a negative at one station produces a positive picture at the other by the successive transmission of many

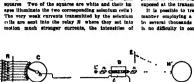

Instead of prolonging the operation in this m Instead of prolonging the operation in this manner it us suppose that it is all done at one. Let us project the image upon a sheat of selenium divided into a very large number of small cells each of which is connected with the receiving station by a separate wire It is avident that in this way the entire picture could be transmitted at once and consequently that electrical vision at a distance could be realized But in order to accomplish this illocounted or wires each connected with appropriate apparatus, would be required and the appense incurred would probably be out of all proportion to the value of the results ob-

This theoretical scheme has not formed the basis This theoretical scheme has not formed the basis of any practical experiments which have ye been brought to public notice. It was announced a few months ago that E Rubmer the well known electrican of Berlin had solved the problem and that his apparatus coulding an enormous som to constitute would be the principal attraction at the Expesition at Frensein in 1910. No details of the apparatus bow over have been published. We know that it supplys over have been published. selenium but we do not know whether it uses wire or many wires

selentum but we do not know whether it uses one wire or many wires

In his state of the problem it seems particularly interesting to not the solution proposed by two French investor's M Rignoux and Frol Fournier some of whose experiments the writer has held good fortune to winness of the problem of the pr number of little coils, and thereby uncover the same number of little mirror to an exten proportion to the strengths of the various currents Beams of light redecad or thicke interors are protected on a secu-cial part of the control of the control degrees of brightness, proportional to their of the correspond-parts of the elsect "Wife a "wely large number of calculum cells, when, coils, and mirrors it would possible to transport as picture with the dealf and plany gradations of light. The departmental desca-pinguish could be acqually under its summary and

crude, but quits convincing. The multiplicity of wires is a serious defect, which the inventors believe they have found means of remedying in their second appe-ratus which is in course of construction and is illus-trated by the accompanying diagram. At the transmitting station the rays of the luminous source L are reflected by the mirror M upon the object O the image of which is projected by the lens I npon the frame of selenium cells T (The diagram shows a frame of eight cells and an object divided into eight equal squares Two of the squares are white and th

THE RIGHGES POSTRATER STATEM OF TRESTISION

which are proportional to those of the selenium call currents to the illumination of the respective coils and to the hrightness of the corresponding parts of the

object. The problem is to transmit all of these currents through a single wire without confusion and to review them and cause them to act separately and simultaneously at the receiving station. For this purpose, Rignoux and Fournier have devised the following arrangement. The currents are conveyed to the contact pieces of the collector of from which they are taken successively by a rapidly rotating wheel which is connected with the receiving station by a

single wire

Let us for the moment disregard the question of speed of transmission and consider the means by which these successive currents are received.

At the receiving station the light of a source Lebalts of the property of the prop

phide, and then falls upon a second Nicol prism w', which is crossed with regard to the first prism. The tube is surrounded by a coll of wire B which is con nected with the wire coming from the transmitting station. Hence the currents which traverse the selec-inm cells for the transmitter flow successively through this coi' and produce an electro-magnetic ro the plane of polarization of the light which is pass-ing through the carbon dissiphide to a degree pro-portional to the illumination of the particular selenportional to the illumination of the particular selec-tum cell which is momentarily connected with the line wire causing corresponding fluctuations in the intensity of the light which emerges from the second Nicel prism of 'This beam of light of varying in tegisty halls upon the ordinder D which rotates in

synchronism with the collector O at the transmittin station, and which carries a number of mirrors Mequal to the number of selenium cells. Hence each mirror reflects a quantity of light proportional to the iliumination of a particular scienium cell and the brightness of the corresponding part of the object.
The mirrors are so arranged that the light reflected The mirrors are so arranged to the light renected by each falls on a different part of the screen E on which is thus produced a mosaic picture formed of patches of various degrees of brightness of the object posed at the transmiting station

It is possible to transmit and make visible in this

manner employing a single wire an image prod by several thousands of scientum cells? Yes "I is no difficulty in constructing a frame of 10 00 There

more solonium cells each connected by a separate wire with a collector which omprises an equal ly large numb r of con tacts Now if we remem ber that the frequency of alternation of an alternat ing current often exceeds 100 000 cycles per second it becomes evident that 10 000 currents can be col icted and transmitted successively over a single

wire in a small fraction of a second By the employment of 10 000 mirrors at the r celving station an image composed of 10 000 patches of light can be projected within the same fraction of a second The different parts of the picture will a ally be projected successively but they will appear to be simultaneous owing to the pusistence of im to be simultaneous owing to the pushelence of im pressions on the retina of the eye if the projection of the entire picture is accomplished within 1/40 second and the apparatus can be so constructed that this proc cas will be repeated indefinitely giving the appear ance of a persistent picture instead of a flecting

Hitherto we have supposed the number of mirrors to be equal to the number of selenium cells—it may be found possible however to diminish the number be found possible however to diminish the number of mirrors and to operate a can improve successively by the currents from several (cilis. This modification void dominists involve completions and difficulties in construction which we need not discuss. For the present it asfires to above that the problem of represent it asfires to above that the problem of represent it as distance by means of a single wire connecting at a distance by means of a single wire connecting at a distance by means of a single wire connecting and Fournier. In the practical realization of the effect result the invarious will have to recknow the interfer result the invarious will have to recknow the interfer result the invarious will have to recknow the interfer result the invarious will not be a first product of the invarious will not be a first product of selection but these are a first these are a first the search of selection but these are found to the search of the search of the control of electric inertia of selenium but these are familiar technical difficulties which will sooner or later be sur

nest one pile with nasther are agt to spread spe when the piles are under strain. Pictured herewis is a new form of shoot piling with strong fields is a new form of cheef pitting with strong fielding joints, an constructed in the copyonis beyonding stiming, coloris, and the construction of the construction of the with relation to each other. Fig. 3 shows a sequence pitting driven in a curred row. Details of the inter-locking parts are given in the sectional view, both show two different forms of pites. Each pite consists of a web 4, fremished with a pair of fanages forms of a web 4, fremished with a pair of fanages from all interiors with the fanages of the next adjacent pites. In the construction shown in Fig. 3, the right and in the construction shown in Fig. 3, the right and in the construction shown in Fig. 3, the right with the form of a book, and a short, alightly curved image C. The right and of the pite is conservant similar in the form of a hook, and a short, slightly curved mange. O. The right end of the pile is somewhat similar in form, the flange B being curved to approximately the same form as flange B, but the flange D is considerably longer than the flange C. Fig. 2 shows a preferred construction. The interlocking parts are of the same design, except that they are made in right and left-

A novel form of gas-main stopper is illustrated in the accompanying engraving. It consists of a facilite disphragm mounted on a collapsible spring frame, which may be expanded in the gas main by secreting which may be expanded in the gas main by serving pressure at two diametrically opposite points. The spring frame is indicated at A in the illustration, and whom in collapsed condition is allibitical or oval in form. The dispiragem attached to the frame is shown at B Connecting opposite extensities of the oval shaped spring frame A are a pair of telescoping men-bers C, to which the operating handles D and B are at tached. It will be evident that when the handle B is bert of, to which the operating handles D and B are al-teched. It will be evident that when the handle S is accepted to the several properties of the several transfer O will telescope, drawing the frame A into dir-cular form In order to provide for operating both of the handle bars simultaneously, a crosshead F is fitted to the outer end of the har D, and is provided with an aperture through which a threaded her G is adapted to pass. The har O terminates in a book, which as-termed to the several properties of the several threaded on the har G and bearing against the cross-head F serves to farm the har T outward, and accep-ted the server of the server of the server of the super into the crowler form in we the stopper is introduced into the gas main through an opening, and inclined with its lower and extending toward the sud facilities that his lower and extending toward the sud residual through the opening and when the themin and is tiphened the frame is brought to a nearly vertical position, as indicated in the drawing, thus pring cross-ties of the sent and effectivally spoping the flow of position, as indicated in this crawing, thus jving cross-wise of the main and effectually stopping the flow of gas. The inventor of this improved gas-main stopper is Mr Patrick Goodman of 257 East 133rd Street, New York city

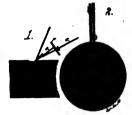

A HOVEL METEOD OF COOPERING CASES. It is customary to build casks with tapering sides, so that the hoops which bind the staves together may be jammed tightly in place. This makes it necessary to shape the staves, which entails considerable waste to since the staves, which entails considerable water of material and much trouble in assembling and bending them into position. Another disadvantages is that teapering or bujeting cask requires more room for storage than if made truly cylindrical. A novel method of overcoming these difficulties has recently been suggested. The accompanying sugarwing literates this method. Between the pieze and the hope rings are pinced, which are tapered as incidented in the sectional view. Fig. 5.

and the start of the section of the control of the contro

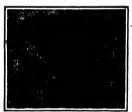

wedged into place, it is made of wire or a strip of metal that is orinkled or bent into a signag or metal that is ermilled or bent into a signal form. This lightens the construction, and pre-vides a better grip on the hoops and staves. In many trades small kups and casks of moderate size for liquids are required, but their high price and the cost of machinery for making them is probabilities for many purposes. The can't here described are especially suited to meet the requirements of such trades, because after the staves and heads are prepared they can be intuhed inside and out (including out can be minuse matter and out (including of ting the groover) in an ordinary isthe, profit ing an inexpensive cask of attractive and it ished appearance. The investor of this now construction is Mr. William Houlker of Nelson

mital athletics exp acress recepted athletics explor was given to some of the remore termed-study after the reson, and greaty re-lieved their distress. A well-known athlete, Mr. Holding, ran an unpaced ter of a mile in fifty seconds after be ter of a mile in fifty escends after breathing oxygen for three minutes; is the trial for the Olympian games be hed been unable to do this in less than fifty-mands. It assums he was not more been unable to up turn in your come of two seconds. It seems he was not more distressed than if he had run one hundred yards; there was, it was reported, a notable absence of that stiffness of the muscles and grogginess in the lage which muscles and grogginess in the legs which follow great exertion in running. An-other atthlets, for Just, after breathing oxygen for three minutes, ran half a mile in one minute and fitty-five seconds, alightly beating his record. I confess I am not much impressed by these achievements. I think, on the co-trary, the preliminaries to them were

caygen is given before a race, this is de-cidedly both unsels and unphysiological. Human energy is thus increased, but the increase is abnormal, as is also the ex-positive of energy. Nor set the increase is abnormal, as is also the ex-positive of energy. Nor set the half of the energy is the energy of the half oping man, as it is, grew into ma-turity with had enough hearts? Every that work is the case. But here we are advased to eliminate unnaturally a heart advased to eliminate unnaturally as a articular properties of the energy of the half of the energy of the energy of the horizon a fact of strength or a trial of endurance, capabilities are thus per-vensely and unnaturally overwought. All stimulastis—oxygen, whishy, cost, and the life—should be given not be-fore, but after, a race, a journey, or a mountain clink, in order to restore tha-fere is a matter which seems to me not altogether trivial. Bestdes, this "topings" of contestance before a race is unportunalistik. Treets of physical hravm and endurance are ligitimate outly when they are made un-legitimate outly when they are made un-legitimate outly when they are made un-

or physical brawn and engurance are legitimate only when they are made un-der normal conditions—those in which human life must ordinarily be lived. The cer normal construence—close in when the man life must ordinarily be lived. The true sportuman will countenance state on only when the contestant depends for more properties of the contestant depends for the contestant depends for the contestant depends for the contestant of the contestant of the contest course had been had between the rain-and this was permissible enough. But a shed had been built out from the rear of the last car, within which the rider kept. He was thus protected from the winds, especially headwinds, and was moreover especially headwinds, and was moreover nesisted by the suction exerted by the fast-moving train. Genuine sportamen rightly held his record to be valueless; for it was achieved under unnatural col-ditions, not under such as must be schanced and grappied with in nature.

DAVID STARR JORDAN.

for Dr Jordan has always been in demand as a speaker from the lecture plat-

Many honors have come to him Many honors have come to him. The degree of M D was conferred on him by the Indiana Medical College in 1875, that of Ph.D was given him by Butler Uniof Ph.D was given him by Butter Uni-versity in 1878, while that of L.D was conteffed on him by his alms mater in 1884, and by the Johns Hopkins Hulter sity in 1902. He is a member of many relentite societies, including the Ameri-can Philosophical Society, and during Andermy of Refences. Busides the fore-going he is a vice president of the Yarne sity Poundation for the Advancement of gie Foundation for the Advancement of Too, hing

vancoment of Science enrolled his name among its members at its second Monceting in 1882, and a year later he was advanced to the grade of Fellow The section on Biology made him its vice-president for the year 1895, but absence from the country prevented him from acfrom the country prevented him from ac-creding the office on that creation Ac-cordingly in 1900 he was again chosen, and previded over the vection at the Den-termining, delivering a reliting address on "The Flah Panns of Japan with Ob-servations on the Geographical Distribu-tion of Plakes" At the meeting held in Pallimore a year ago this 'inse' Di Joi dan was tho unanimous choice of bit se' pulific associates for the highest office in the gifl of the Association, and will take

A MEM CYMA

(Concluded from page 15)

It consists in general of a peg pro-vided with a set of recesses which are numbered 5 10 15, etc and a proair numbered 5 10 15, etc and a pro-jetting device adapted to throw a ring on this peg, so that it will hang from any one of these recesses. The project-ing device casts the ring in such a way ling distic casts the ring in such a way that il turns a complete somersault in transit, which adds to the difficulty of making the ting fall in the recent hear ling the highest number. The projecting device is shown in detail in cross sectional view it consider of a liver 4 provided at its lower and with a flat A Home-Made 100-Mile plate B adapted to receive the projectile.
The lever 4 is mounted between a pair The lever 4 is mounted between a pair of nprights (* and a spring D presses the lever upward against a stop piece. The ring II is placed on the plant II and then the lever is collect, as indicated by the doiled lines, and on being saids fily to leased throws the ring to the pog F. The revesses above referred to are indicated at G. It will be evident that Consider-able skill is required to gage the exact height to which the liver 4 minst be lifted, so that when released it will throw the ting to the desired recess mulst in operating the projector the Jup crosspiece of the fisms (* projects at each crosspires of the traint C projects at each side, and provides a rest for the finge is while the thumb is engaging the end of the lever A. The invenior of this game is Mr. Pierre V. Ericson, Chernkie Avenue, Hollis, Long Ia'and N. Y.

In a recent number of the Zelischrift Phys. Chem. T Stedberg describes some experiments on the limit of visibility of color produced by various substances in dilute solutions passing from coppor sul-phate in fuchsine and colloidal gold. It phate in furbalue and colloidal gold it is shown that in the case of colloidal par-licies the absorptive power is at first al-most independent of the size, but pro-portional to the number, of the particles On reducing the size of the particles.
On reducing the size of the particles, how
over, their absorptive power becomes less
and finally the ordinary condition of a
transparent (true) solution is situined Syedborg argues that his experiments Byedborg argues that his caparition-demonstrate the continuity of the collud-al and crystalloid states, and therefore the corporeal existence of molecules

A REW ERA OF THE STRAM REGINS.

y I' in the days of the perfected quadruple-expansion seam engine, anyone had ventured to criticise the type as boing very insufficient as means of cattracting the heat energy of the steam that passed through it, he would have been considered as hypercritical, to say the least had if he had ventured to predict that within a few years, by interpolar and the condemner, it would become possible to down as increased ecotomy of rour 25 to 35 per cent, and the condemner, it would become possible to down as increased ecotomy of rour 25 to 35 per cent, output of an weighte by from 70 to 100 per cent, he would have been regarded as a viliceary Yet! it is a fact that this doubling of the capacity of an engine her actually been accomplished, as staded in our editors F in the days of the perfected quadrunie-expansion actually been accomplished, as stated in our editories of December 18th, 1909, describing the remarkable

actually been accomplished, as stated in our officioned of Docember 16th, 1000, describing the remarkable work being done at the Pitty sinth Street power states of the property of the proper corresponding rise in steam pressure, which led to a gradual shandoment of the condense and a tendency gradual shandoment of the condense and a tendency to obtain the desired horse-power by working on the higher ranges of pressure. The high-pressure engine exhausting directly to the atmosphere was, of cotines, an extremely swaterful device, and the invention of the compound engine was logical and inevitable. Then followed the triple and quadruple engines, the limit of expansion being reached when the low-pressure cytin-der became too large for practical jumpones. If a cylin-der became too large for practical limit of re-diprocal-sistent down to the rull theoretical limit of re-diprocal-sistent down to the rull theoretical limit of re-diprocal-ised to the rull theoretical limit of re-diprocal-ised to the rull theoretical limit of re-dipro-serated out of all proportion to the rest of the engine; the weight would be amornous, and the losses through fritting, and be ause of the great radiating curface, would be pro-libitive. would be probibitive.

The steam turbine, on the other hand, is particu-larly adapted for accommodating the great expansion of the steam in the lower ranges of pressure, just as the reciprocating engine is better suited for develop-ing the expansion in the higher ranges. The turbine iosses in the higher ranges are largely due to the fric-tion of the rapidly revolving blades in the steam at tion or the rabitity revolving biades in the steam at its relatively high density when under high pressure, whereas akin frittion is not a serious factor during the expansion of steam in a high-pressure cylinder At the lower pressures the steam has a small density, and the skin friction losses are inconsiderable. Again, the great drop in temperature in a low-pressure cylin-dar induces rapid condensation, and greatly reduces

the efficiency
Hence, it will be seen that the reciprocating engine
working on the higher ranges of pressure and the
turbine working on the lower ranges are the complements, the one of the other, and when acting in our

ments, the one of the other, and when acting in com-bination form an ideally economical arrangement. The range of application of the new system is wide, and alteredy the turbins is winning book for usually work an agromous amount of hest which was derivery lost in the reversing rolling ongine at the steel works,

Scientific Asserted

in the winding employ of collection, and by the great collection of the power federated by the collection of the collect

BAPID TRANSIT BY BRLT CONVEYER.

BAPIS TRANSET ST BREE CONVEYER.

Y the action of the Board of Estimate of this city, which, on Documber Srd last, passed a resolution authorising the Public Service Commission to lay out a moving platform subway in Thirty-fourth Street between Second and Ninth Avenues, there will be given an opportunity to test a system of transportation which we have always considered to be ideally adapted for relieving the crowded traffic conditions in congented centers of large

By far the most efficient means of moving r in bulk is the bult conveyer. For transporting ma-terial that is in a more or less finely divided condi-tion, or made up of a large number of small separate tion, or made up or a large number of small separate units, such material, for finishape, as grain, coal, iron are, the belt conveyor is recognized in the in-dustrial world as having no equal—provided, of course, that the distance to which the material is to be carried and the speed are not excessive

e moving platform is practically a continuo boil conveyer for the conveyance of a large number of passengers at moderate speed. It consists of short lengths of platform, coupled together, forming an endlengths of platform, coupled together, forming an end-close chain which is kept in continuous motion. In the Thirty fourth Sitrest subway there will be four parallel rows of platform, the first, adjoining the sta-tion platform, moving at three miles an hour, the next at six miles, the third at sina miles, which fourth, which will be sullively covered from end to end with seats, will move continuously at twelve niles an hour. Entrances to the morting-platform submines an nour Entrances to the moving-pattorn sub-way will be placed at every intersecting arome or street, as the case may be The capacity will be 73,500 seated passengers per hour in one direction during the rush hour, as against 13,00 seated passengers on the eight-car express train service and 7,500 on the five-

eightear express train service and 7,500 on the five-cer local train service of the subway, and an against \$8,000 standing and seated passengers per hour of the express service and 22,500 on the local service in a recent communication to the Public Service Commission by list chief ediginer, Heavy B Seaton, the advantages of the new system are stated to be-First, a vastily intreased capacity and seats for a passengers, second, absence of the delay incurred by a visiting for trains at stations since the train is always there and constantly moving third, the fact that pas-sengers may board or leves the train at any point at sengers may board or leave the train at any point at will, and that instead of placing stations one-third of a mile apart, as on the present subway, they may be a min spart, as on the present subway, they may be placed at every cruss street, or ladeed at any inter-mediate point. Furthermore, the subway construction may take the form of a continuous areade, thus pro-viding an additional business front for display add

viding on additional quantees from our ampley now shopping purposes. Although the moving platform speed of twelve misses Although the moving platform speed of twelve misses per hour may seem somewhat allow as compared with the running speed of a subway frain, the difference is not nearly so great as might be supposed, and, indeed, over the shorter distances, is entirely in favor of the shorter distances, is entirely in favor of over the shorter distances, is entirely in fivor of the new system. The Commission's engineer fields that for all distances of test than four miles the moving platform is a quicker and move convenient mode of convenance than the local fruit service, or even quick-er than the local and express service combined, a passenger reaching Times Square Station, Forty-scool Street, from any local station south of Pour-second Street, from any local station south of Pourtreath Street quicker by the moving platform than by teems Street quicker by the moving platform than by the local and express trains of the present subway. The local trains ordinarily average, including stops, about fitted miles per bour, and twelve miles au hour during the runh of trains. If this runh hour services

about inferm intello spring, and twaiter mines at hours during the reads of trails. It is this rush hour service is compared with a pitchirum speed of tweiter mines to posteriors will have the adjustance for all distances, however, there is no trail internal to wast and however, the service of the service

The universal vise invented by P Glosg en is mounted on a ball and socket joint which allows it and the object held by it to be turned in a y dir tion so that the work an be done more conven-iently and in a favorable light Wien the vise has been set in the desir d position the ball and so ket joint is locked and held motioniess joint is locked and held motioniess by a do ble joi ed jaw opera ed by a vira; termina ing in a loop in whi h h workman a foot is placed As he accompanying photograph indicates the niversal vise is de

signed primarily for the use of shoen akers It can be employed with advantage in shaping sewing nailing and alm e ery other operation involved in the making and re pairing of shoes. The shoe and the standard which

carries it can be turned into any position and instantly immobilized without touching the screw of the vise so that shaping can be done mu h better than is possible with a rotating vertical standard as the sole and the heel can be placed in the jositions most favorable

The apparat s is very simple and comprises only five large parts and two pins.

The Pacific coast i mber man facturers have taken the initiative in an important step for the promotion of

proper and conservative use of their timber supply Practically all of the large manufacturers of lumber in the Bitase of Oregon and Washington have entered into an agreement to manufacture old as well as even lengths in Society finish and strike planning lengths in Society finish and attrike planning to products. Heretotres it has been customary to manu-facture these products in even lengths only New 4t is proposed to trim the manufactured lumber to lengths is proposed to trim the manufactured lumber to of odd numbers as well as even numbers of feet

THE WHIVEBALL VIEW

the old system a considerable portion of the iumber which came to the shaping machine was wasted and this action has been taken in order to save that waste this action has been taken in order to awe that water Considerable opposition to the interovation has arisen among rekallers and consumers. The retailer contends that it is impossible for him to dispose of old length material because of the common practice in the con-struction of woods buildings claiming that the initial saving of the manufacturer is transferred to the con-sumer. This is denied heavest because of the pro-portionality small amount of old length material which will court under the new prints and because of the initer day practice of Juriar sub-Boors of rough lumber and cheating on the sides of the home before putting the finishing material in piece. Because of the con-servation element which asters into this genetics, the United States Private Service has been precuremeding the adoption of odd inequis for some time past. The Perland ellies of the Service has redestly made as investigation of the actual amount of unsecurity wash incident to the manufacture of even jumples only

investigation of the actual amount of unnecessity weeks incident to the manufacture of even lengths only and these figures above that under the old system the refuse burner commond there two per cent of the foldal continuous and the state of the control of the mul products into lengths of odd feet as well as even it would re-quire the yearly growth of timber on approximately 20 000 acres of average timber land to produce the

amount of lumber which this an nual waste represents The manufacturer is convinced that the waste is unnecessary. His greatest trouble new lies with a similar conviction on the part of the communer that odd lengths can be used as economically

The new Mexican Pan American Tailway has already been opened states the American Machinist and the line is in active operation from Ban Jeronimo as the Tubnantupoc Railway to Tapachula in Chiapaa. The Tehnantepec Railway to Tapachula in Chiapas. The extension of that line will be continued to Poet Ban Benito on the Pacific coast. There is also planned a new railway passing through parts of the States of Coabulla and Chihushus, about \$75 miles long.

MECHANICAL BOWLING MACHINE.

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

Namero s efforts have been made from time to time to devise an echanical apparatus for reproducing hu unan action in the folivery of a bail in various games here such is required su h as basebati cricket ten ins and so forth. The problem however is somewhat abstruer insamuch as in bowling success is largely de abstruce inasmuch as in bowling success is largely de-pendent upon the brains of the bowler who resorts to varying subterfuges to complex his opposent such as varying the pace sewere and break of the ball while in the air or after it has struck the ground. To repro-duce these pocularia les by mechanical effort is no easy matter but an English engineer MY D D Fason MI MN of left minghan has perfected an ingest one active for futiliting the desired

As may be seen the apparatus comprises a tripod of steel tuhing firmly fixed to the ground by means of specialty designed anchors which correspond to the body of the bowler The ball rosts freely the bowler The ball rosts treely in a semi-spherical cup or hand carried at the outer and of a lever about the tength of the human arm with which it corresponds the low r end of this tever being ply oted to the body at the shoul

When the machine is at rest the and the bowling operation is proand the bowing operation is pro-duced by pressing this arm back ward into a horizontal position with the ball resting in the cup-chaped hand. Directly the arm is released it flies toward its normal position describing therein a quar-ter of a circle the ball being pro-pelled through the air with varying pelled through the air with varying velocity as desired toward its objecthe moving arm is produced by the action of a strong spiral spring one end of which is attached to the moving lever a short distance above the shoulder while the other end is attached to the body by an adjustable tightening screw By means of this screw the momentum imparted to the arm and

cas serve use momentum imparted to the arm and consequently the velocity of the ball can be regulated merely by altering the tension of the spiral spring. A ball delivered in this manner though fast or slow according to variation of spring tension is a straight-forward delivery—it possesses none of that swerre spin or gyration causing it to break to the right or

Inserting the ball in the "hand" of the A MERCHANNAL ROWLING MARRIED

The succides in the set of the order.

left when coming into contact with the ground and which is so bailing to the bateman. This requirement is fulfilled in an ingestion immer. The center of the cup-shaped receptacle or paim of the mechasical hand has roller or draw title its acti remaing transversely with the bottom of the cup and having its pertiberry rejecting nightly above the spherical nursine of the paim so that when the ball is inserted it reads upon the contract of the contract of the contract of the paim of the view of the contract of the contract of the paim of the contract of the contract of the paim of the contract of the contract of the contract of the of the cup will fit against the four internal sides of its containing to or. Attached to the

AN AUTOMATIC RAILWAY SAFETY STOP.

BY DR ALFRED GRADENWITZ

Since the service entertrophs on the Berlin Ele-tered and Deforground Rallway caused by a train reaching by a stooping signal, the German rulway afministrations have been giving increased attention to automatic braking devices for pre-reating the recurrence of such acci-dents. The automatica (Warners)

The apparatus illustrated in the dents. The apparatus (iteatrated in the secompanying figures has been adopt-ed provisionally, and is now being tested cut. Its object is to warn the engineer and fireman by visible and sound signals and set the brakes, all be-

g done simultaneously The saiety device consists of cor The safety derise consists of contact inverse monitor on the local manufactures are made pressured to the local manufactures are subject as a pressure as a subject are subject as a subject of the right-hand side of the engine, and are actuated by a permanently tightened spiral spring. In the interior of the only is a subject of the subject of the pressure of the interior of the subject of the subject of the interior of the third pressure of the subject of the subject of the tracking to the driver (1) whether the track is disengated, (3) whether the track is di

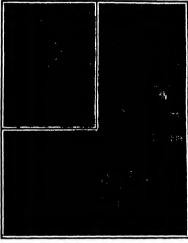

frame, immediately before the engineer's syst.

Above this repeating box is arranged a recording box, which mainly contains a clockwork, which is actuated if the train runs by some signal. This clockwork eats a roller and paper tape rotating and thus causes a dash of ot to be inserfled. Furthermore, the engine of the containing and thus causes a dash of the inserfled. Furthermore, the engine of the containing and thus causes a dash to the same of the containing and the cause of its depart, as an uniter mark, showing the signal have been duly attended to Those marks may serve as useful records in the case of its wanter.

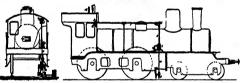

marks may serve as useful records in the case of law-stifa. On the roof of the driver's stand is mented an alarm siren, the howing sound of which is readily distinguished from that of ordinary locemotive whiteles. The same siren is used as a probating signal in the case of brakeless goods trains. On the run-sing board of the locomotive

ning board of the locomotive is arranged the brake-cock cening 5, containing, in addi-tion to the brake-cock, as click for tightening the spring above mentioned, and, accord-lagly, the whole apparents. This click, in turn, is con-tected through the draw-bar nected through the draw-bar 10 with the contact levers 6. 10 with the contact levers 6.
These two contact levers 6 on sliding over the contacts pull downward the draw-bar 10 and thus set the apparatus working. The apparatus is

actuated only in the event of both levers being struck simultaneously. This arrangement thus insures thor-ough reliability of operation

Tripping devices in operation.

rwing arrangement of track and engine contacts warning devices in eah

cituated only in the event of both levers being struck multiaceously. This arrangement thus insures thorpooned the structure of track contacts, and at the main signal, two multiaceously. This arrangement thus insures thorpooned the signal as to be lifted when the signal is closed, thus protructing beyond the rail head signal is closed, thus protructing beyond the rail head and coming into contact with the silfed

and coming into contact with the mining levers of the locomotive, whereas, in the event of the signal being drawn, they are located below the rail head, so as to avoid any contact.

In addition to these stationary ped-

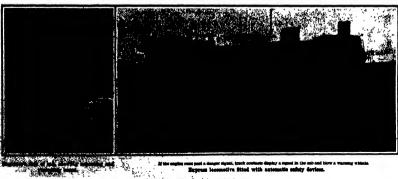

als movable pedals are provided which are readily fitted behind fish plates. with a view to warn and stop trains at

The working of the apparatus is as follows On the contact levers passing over the track contacts, the draw bar 10 is pulled down, thus disengaging the click The apparatus is merely overated by the spiral spring, and as the contact levers perform no work outside of disongaging the tightening apparat-ns, any heavy shocks are prevented, and the wear and tear is reduced consider ably

On passing over a distant signal, the contact lovers strike only a single pair of pedals situated on the track, thus closing an electric circuit, by the ac closing an electric (ricuit, by the ac-tion of which the alarm siren is sounded, while a disk bearing the in scription "distant signal" pepars in the cah signal box and a dash is mark ed on the paper tape in the repeating box. The brake cock is opened at the same time and the train is slopped auto-matically. Other to the asset in the acceptance of the same time and the train is slopped auto-matically. Other to the acceptance of the same time and the train is slopped auto-Owing to the auto ongagement of the brakes, the driver is in a position himself to throw the ap-paratus out of goar, and to continue his journey On a closed main signal being po

over, the contact with the first pair of pedals produces an effect, as above stated, during a very short time which second pair of track contacts in fact, this second contact further disengages

this accord contact further disengages the tiles, thus opening completely the braking cox and producing a rapid braking At the repeating box appears a disk with the inscription "main signal," while at the same time a dot is marked in the recording box in addition to this, a checking lead is broken. The second contact also causes the amoratum to also causes the apparatus to become locked up, so that the engine driver is no longer in a position himself to throw the apparatus out of gear, be-fore the train guard has re-

une part a danger signal, truck contacts display a signal in the one and bi Express locamotive Sited with automatic anduty devices.

FRICTION

AT RAILWAY CURVES.

BY J. F. SPRINGER.

When two material surfaces are in contact with each other, there are two distinct methods of with drawing points of contact from each other Consider such points to be extremely small plane areas. Thus, let Fig. I represent a highly magnified sectional view het Fig I represent a nignly magninous sectional view of two consisting points. All represents the infinitesimal plane area. (First) The surfaces may be with drawn from each other by moving C or D (or both simultaneously) in a direction perpendicular to tha plane represented by AB. This gives rise to what is termed rolling friction (Second) Withdrawal may be effected by moving C or D (or both simultaneously) in any one of the directions lying in the plane repr sented by AB. Thus, the movement may be sions AB The direction is immaterial, provided it is in the tiny rise to sliding friction

Now material applaces are not perfectly amonth When in contact under pressure, the projecting parti-cles interiork with each other--as idealized in Fig 2 dily is seen that movement in th () H would lend to shear off the large projections 1, 2, 3 4, while movement in the directions B, F would tend to shear off merely the interlocking protuberances of the large projections. That is to say, sliding fric-tion involves abrasion of the principal projections, while rolling friction relates merely to proje projections Consequently, it is not difficult to comprehend that sliding and rolling frictions belong to different orders of magnitude. In fact the one kind of friction is a most important consideration in me-chanical angineering, while the other is usually norti-

it is easily seen that the movement sions AB pro-It is easily seen that the movement along AB pro-duces what we all understand by sliding friction, but perhaps some may healtate at considering perpendicu lar withdrawal as rolling friction. Consider Fig. 3. Here the wheel is rolled in the direction given by the serve of the waser is rotted in the direction given by the arrow of The removal of the points contacting at A is office ted by the change of the instantaneous center of rotation from A4' to the next point BB' [See arrior 'Some Principles of Bail Bearing Design' in Sorra "Some Frinciples of Hall Bearing Design" in Betra Title Assucks for November 6th, 1939 1 in mak-ing this change, A moves perpendicularly away from A' Likewise B approaches B' perpendicularly And so on throughout the roll—the points of contact ap-proach and recede from each other perpendicularly to the surfaces of contact

Now it will not be very hard to see that any move-ment of withdrawal that is oblique is really a compound of the perpondicular and parallel movements. We may provisionally assume that in so far as it is

We may provisionally assume that in so far as it is parallel it is a rolling friction, and that in so far as it is parallel it is a liding one. That there are such compound frictions may be seen by committing the article to which reference has airward been made. Now two very important exonnic questions arise in connection with frittion. First, friction severe the incenticing parts. This is a matter of very confidenable significances descond, friction countempower in performing this abrasion. In some cases, this becomes a matter of still greated as a matter of still greated as a matter of still greated and the still provided the stil waste of the power used in accomplishing this destruc-

These two factors have, perhaps, been more or loss recognized almost from the beginning of the age of machinery But it is only in comparatively recent years that their vitai importance has begun to come to tha fore. In every direction in the machine world this is testified to at the present time by the intro-duction of ball and roller bearings Those serve—with duction of ball and roller bearings These serve—with more or less perfection—to accomplish the exchange of aliding for rolling friction in the railway world, the antifriction movement is attested by the fact that large outlays are being made to sliminate the friction at curves. Roduction of time is no doubt also in view But the railroads cortainly have in view the connumic gain to be derived from the avoidance of that excessive wear on rall and wheel which occurs when round ing a curve, and the money advantage in saving the sleam power wasted in effecting the wear and tear

steam power waster in stretching to vear and user. That railway curves give rise to a very excessive amount of friction may be understood from the amount of war occurring at a certain curva in the "subway" of the Boaton Rievated Railway Carbon-steel rails were replaced at a certain point, on the average, every forty four days. The amount of wearing down on the heads of these rails was about three-quarters of an inch As to what happened to the wheels in accom-pliability this wear, no one has any exact information. But it must have been very considerable. Three-quarters of an inch was not worn off the rail head with-out a corresponding effect on the wheels and trucks.

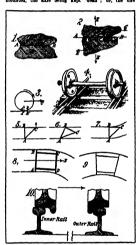

What happened at this curve is happening. In

greater or less degree, upon all curves, wherever located. It is a matter of interest and importance, then. cated. It is a matter of interest and importance, then, to consider more particularly the causes of friction at railway curves

Three prominent factors enter The first causal fac-tor arises out of two facts. The outer rail of a curved track is ionger than the inner one, And yet the one must be covered in the same time as the other The and the corresponding axis operate as a single piece.

Consequently, the one wheel is compelled to rotate at precisely the same speed as the other. In rounding a curre, however, a greater distance is covered by the curve, however, a greater distance is covered by the some This conflict of rotational velocities between the two wheels results in slippage, and this of course means wear of metal and lose of power It is to be observed that this friction occurs irrespective of the speed of the train For the difference in length of rail between the two sides of the track remains precise the course of the state of the track remains precise the contract of the state of the track remains precise the course of the state of the track remains precise the course of the state of the cisely the same, and this controls the amount of slip-page. The seriousness of the friction is accentuated. wever, by the speed

nowers, by the speed it has been proposed so to arrange the whoels and axle that this slippage could not occur. This might be done in two ways. Both wheels might be rotatably mounted, the axle being kept "dead"; or, the one

PRICTION AT RAILWAY CURVES

wheel might be made integral with the axis, and the other rotatably mounted. That either method would be effective can scarcely be doubted, but practical rail-road people do not seem to take kindly to wheels mounted rotatably on an axis.

read people do not seem to take kindly to wheels monuted rotatably on an acts.

Whather they are justified or not, there is another riction factor which anters and whelh so first greater weight. In order to get this clearly before the mind it will be well, perhaps, to consider the action of a group of finging wheels on a railway track. Buppose take a single pair of wheels and the corresponding axis. These wheels are fanged on the inside, as in Fig. 4. Now it will readily be straided that the sale work of the sale will be suffered to the sale will be suffered to

represents such as agrangement, the wheel contacts being supposed to be at the vertices A, 2 and O. This truck would no death withstand any tendesory operating to threw it is the direction of the arrow at O. But a tendesory in the opposite direction would review the to the situation in Fig. 8. If at no other time, such a tendesory would arise at ourse in the track when the rull corresponding to 20 tended away from the truck as a whole This condition of affaire is

rapresented in Fig. ?

The lowest number of wheels which when combine in a truck are competent to maintain themselves up a track is four. The four-wheeled track is onse a track is four. The four-wheeled track is cons quantly the unit that must be dealt with in conside ing the friction arising at curves.

Now when such a truck rounds a curve, the or wheel of the forward axis is the one which first m where or use forward ages as the one which first meeter the change of direction. This is shown in Fig. 8, where the wheel at θ has begun to respond to the outrature. The wheel at θ , because the rail curves away from it, will tend to be reliaved. The impotens of the truch is in the direction S. Consequently, there is a severe grain at θ . And this condition obtains throughout the curve.

No doubt if, during the time of rounding the ou the axies of the truck could always lie in radii of the curve, as shown in Fig 9, the friction arising from the rigidity of the truck formation would be is reduced, if not antirely eliminated. Inventors ing to attack this problem must remember that the ar-rangement of the truck cannot be fiscible. The change from the rectangular form to that of the isosceles from the rectangular form to that of the isosceles trapeoid must be sufficiently instantaneous. If must not go further than requirements demand. Further, conditions must be reversible for curves bending in the opposite direction Altogether, this is a very

restly problem.

Another factor which enters is one political out by Mr. Edward Godfrey. The tread of the wheel is not borizontal, but lucified, as in Fig. 10. On the outlet wheel of the forward sate the climbing leadency resulting from the effort of the truck to move it stringful line forces the wheel famps to some such peach to as that shown in the figure. This is also do doubt, by the fact that thus greater speed is sittained for the same of the same and the same operate to the sieving of the whole acts cutward, because thus a less speed is obtained on the times of the truck. Now the result of this sieving is to thrive a very scheen portion of the outer when its is of the truck. Now the result of this sisting is to bring a very steep portion of the outer wheel in con-tact with the head of the rail. There arises, thus, a severe wedge action. This is, perhaps, the most im-portant of all the factors giving rise to friction at curves. It is due to a combination of the causes producing the other two.

th of William A. Midv.

William A Eddy, well known throughout the co try for his many kite-flying experiments, died recently try for his many site-nying experiments, case recently after an illness of several months. Mr Eddy's life was sport in the study of kits flying, to which art his contributed much that is valuable. Although a self-taught man, he did much useful work, particularly in kits photography Latterly he was very much interested in seronauties, to which his kits investigations

Dr. Carritis of Yienna, who has undertaken a study of the chemical structure of cannabriol, the active principle of hashibit or Indian Aunu, gives the fellowing graphic description of the pacular intorination which hashibit produces. "It is as if the sent illustration which hashibit produces the as often of your branching array throught that pusses through the brain, and every bodily movement is a source of yor. The hashibe state does not experience the kind of pleasure which is produced by the gratification of bodily apparities. Its feels the joy of one who hears good never, which is produced by the gratification of bodily apparities. Its feels the joy of one who hears good never the miner counting his gold, of the incutry gambler, of covery impulse and the oursets of the thought in diverted by the slightest impuration. Not one of a pacture sufficien to suggest may jrappe and these, with marriculum quicinesses and predefine. For this remains the Greenian hashibat start, before he gives kinned to the outprease of the direct in the contraction of the contraction of the contraction of the outprease of the contraction o Dr. Czerkis of Vienna, who has undertaken a study

TER STEED OF AN AUTOFILER PROFILER.
The idea of propolities a huge machine weighthe half a test at the spood of an anymen train by means of a fan assess absert on the face of it. One is apt to discount the power of a fan Art as such an intampleis, improadrable, replantations limit, that it seems to propose the contraction of the contr possible to obtain sufficient thrust against it to drive a machine of any appreciable weight. Yet this is what a firing machine propeller must do. The result is ob-tained by making the propeller of such size and driv-long it at such speed that when the machine is held stationary, the propeller will generate a current of six flowing at the rate of a hurricans. We know semsart flowing at the rate of a hurricane. We move sum-thing about the power of heavy gales, and when we consider that an aeropiane propeller is capable of pro-ducing a moderate-stand cyclone, it is easier to con-ceive of its secretage sufficient force to drive a 1,000-pound aeropiane at a fast clip. Plying machines have ttained a speed of over fifty miles per hour In orde to do this, the propellers must have been driven fast chough to have produced a current of air considerably more than this velocity, because the fluidity and elasticmore than this velocity, because the fluidity and sizeful ty of the air is emificient to cause a considerable "silp" of the propellers, which reduces their efficiency to a large artent, depending upon the design of the propeller Our front-page illustration this week shows Mr. Hubert Lathans "Antiolavit" monoplane under going a test of its propeller The propeller is revolving at the rate of about 1,100 revolutions per minute, which is about the rate of the average electric fam. but when we consider that the propeller describes circle 6¼ feet in diameter, some idea of the volum circle 6% feet in diameter, some idea of the volume of air set in motion by the machine can be conceived At a test made in England last fall, a thrust of 265 pounds was obtained Supposing the motor to de-velop only 30 horse-power instead of the 60 at which it is rated, this is equivalent to but 8.8 pounds per It is rated, this is equivalent to but 8.3 pounds per horse-power, which is about all the average program will give. A prominent American experimenter has interjo obtained 285 pounds trust with a 50-box power motor, but in this instance a large 4-box pre-pailer making int 400 R.P. M was used Both a pre-pailer making int 400 R.P. M was used Both a pre-pailer making int 400 R.P. M was used Both a pre-pailer making int 400 R.P. M was used Both a pre-pailer making int 400 R.P. M was used Both a pre-pailer making int 400 R.P. M was used Both a pro-pailer making into 400 R.P. M was used Both a pro-pailer making into 400 R.P. M was used Both a pro-ting the sound of the second of the second of the second of the total second of the second of the second of the second of the trust of the second of the sec the rapidly rotating propeller is cut at two points by wide dark bands. These are chadows cast on the blades The chadows are, of course, intermittent, as blades The shadows are, of course, intermittant, as they full upon the blades only as they come with the range of the shadows. This suggests an experiment which was eventiled to us some time ago by one of the readers of the SCRETIFF AMERICAN HE proposition appeared rather starting, but he soon the construction of the many factor of the many factor of the many factor of the starting profiled chadow, showly one the string, provided the string according to the many factor of the string, provided the string according to the many factor of the string, provided the string according to the many factor of the string provided the string according to the string provided the string to eng ang waities around so that it formed a hazy patch of reflected light estimilar to that produced by the propeller hisdes in our front page illustration. The persistence of vision of course accounts for the haze in the first place and for the shadow as well, because both are intermittent, as an instantaneous photograph

The Fublic Bath System of New York City.

In a paper presented before Section 1 of the American Association for the Advancement of Selence, at the Boston meeting, Documber Sith, 1909, suttled "The Public Bath System of New York City," by William H. Hale, Ph.D. Shperinendent of Public Baths of Procklyn bowayed of New York City, some interesting facts were stated showing the increases and utility of this recent point institution for the promotion of the

error to the consolidation of the surrounding cities into Greater New York there was no interior public bath. All were located along the error front as float-ing baths. The first interior nobile bath in the second bath. All were located along the river from as non-ing baths. The first interior public bath in Manhattan borough was established on Rivington Street on the east side of the city March 23rd, 1901, and has been the most crowded of any bath, on the average, for the

NAM.
Newer baths opened on Pilkin and Montrose Avenues, Brooklyn bortuch, have hed more interest to make the many others. It is attact that on one hot estimated day 3,000 bathers used them. A third public of the state of the s

later bath houses swimming pools have been built sixty fact long by thirty-sine feet wide, said to be the largest in the city. Never buth houses have a symmasium built in the second story above the bath house proper. This has been found to be a most use ful adjunct. Mr Hale suggested still further that roof gardens be built above the gymnasium. He also recommended that there should be a greater extension of facilities for public bathing, particularly the establishment of a great public bath by the sea modeled after the baths at Revers Beach and Manhaset Bunch in chusetts. At Coney Island on city property st public bath structures could be constructed as would be remunerative to the city and yet would supply a pre-ing public want. Mr Hale further recommends the tablishment of a separate bureau of public baths and tablishment of a separate bureau or puone caton and gymnasiums, with uniform pay to attendants and offi-cers, to cover the whole city The city should have full control of the proposed seaside baths, as they are cers, to cover the whole city. The city should have full control of the proposed seaside baths, as they are intended for the entire city and not wholly for the borough in which they are located.

RELATIVE POSITIONS OF MALLET'S COMET, THE BARTE, AND THE SUN

At the top of the accompanying drawing the cor At the top of the accompanying drawing the comet is shown in its position for January 1st, 1910, outside of the orbit of Mars. At the left the earth is moving in its orbit away from the comet, the distance between tham being about 115 million miles

tham being about 116 million miles
On March 24th the earth will reach the position
shown in the drawing, while the comet will have
moved to a point on the opposite side of the sun During this period (January ist to March 24th) the comet will be visible, with the telescope, in the western evening sky, but on March 24th, when passing back

RELATIVE POSITIONS OF HALLEY'S COMET, THE RARTH AND THE SUR.

of the sun, will be invisible for several days. The distance between the earth and comet at this time will be 165,000,000 miles.

When the comet next emerges from the rays of the sun it will have shifted to the morning sky, rising san it will have shifted to the morning spy, rising before dawn, and for the first time becoming an intor-cating object to the naked-up observer. The earth and comet will now rapidly approach each other and the latter will greatly increase in brilliancy.

About April 20th it will pass its nearest point to the sun, as shown in the drawing, and on May 18th with sup, as soown in the crawing, and on any four win again disappear in the sun's rays—this time, however, passing in the front of the great luminary it is pre-dicted that the nucleus will cross the sun's disk about five minutes of a degree from its center, thus furnish ing an opportunity to observe whether the nucleus is

ong an opportunity to observe whether too intrins in opaque to the sun's rays. The transit will not be visible in the United States as it will occur after sunset here On the night of May 18th the sarth and comet will un the night or May 18th the sarth and comet will rush past each other and the earth will probably sweep through the tail of the comet. They will be only 12, 000,000 miles apart. After May 18th the comet will strain its maximum of splendor in the swening sky, and in a few days thereafter its glory will rapidly fade.

THE INVENTOR OF THE STRAMBOAT

To the Editor of the ECHTPIN AMPRICAN
I beg to thank you for publishing my letter, as also
for your courtesy in sending me the copies of your

I wish to point out that although I insist that it would be a most difficult matter to prove that any other of the so-called inventors have any just claim to priority, yet if any reliable proof of any "invost having produced a practically successful steams "inventor' having produced a practicatify successful atomatods prior to 174 its available, then I would once for all sink any taim on behalf of Jonathan Hulls, but in my humble opinion, from research I have made upon he subject, such its not possible. Therefore I boildy search that he and he alone should have the great observation of the production of the product

tor a memory, it should not be for the purpose of re-quiring commercial success He laid the foundation for commercial success this fast is undensable, therefore why should be not have the honors and dis-tinction for his genius? Always remembering that he

eas many years ahead of his competitors

I do not admit, what is so generally claimed, that it is not the man who invents, as the man who puts It is not the man who invents, as the man who puts into actual practice, that is descriping of the honors. Without the man who invents, there could not be any need. Neither would be have any place for putting into practice that which he would otherwise have had no knowledge of, had it not been for the earlier inventors

ers clear that Jonathan Huils, although the side-paddle boat had existed for many years propelled by both manual and animal labor, yet he was absoboth meaning and agent atom power to supers, but in the strength of the streng And with his with the side paddles, his cistm to originality is made with the made pagness, his craim to originality is made doubly sure, always remembering the very early date of his invention and the very crude form of steam engine which then existed. Therefore the greater the r that should be accorded to him

With regard to Fulton, no serious cisim can stand in face of the foregoing. To put it mildly he was only a copylet in the matter of steam propulsion cannot too foreibly assert that Robert Fulton has no cannot too forein); seaser that Know-r whom has an claim whatever, and this fact Know-r whom has a reported. This gentleman asserts that "England should certainly set up a monument for Jonathan Hulls, as he was undoubledly the original inventor in England", and he further states "whether he actually built the boat or not is of no special conse-cutability built the boat or not is of no special consequence

have been able to provide proof that he did build his boat, and that it was a practical success quently, any additional proofs I have supporting him -- and they are numerous -- would be quite superfluous. onld not possibly be more than one inven tor of steam navigation, whatever adjectives be us J. Hooves HULLS

GLASS ESPALIER WALLS.

BY JACQUES BOYER

In the cottivation of fruits on the espalier system the trees and vines are planted along a wall of stood brick to with all their branches are arready attached so as to spread them out into a plane sur for an a side of write ace so flight and air to every part Ordinarily the dire tion of the sail is desired including the control of the sail is desired and the varieties of pears herries I aches apricots apples and other f uits whi h are planted along the wall are selected

with refer nce to his di centing if the wall was built in an east and west direction so as to expose one face to the south the one face to the south the other face was almost? tirely wasted. In order to remedy this state of af fairs several fr it grow ors have conceived the idea of employing trans-parent espalier walls through which the light of the sun can penetrate to the trees planted on the north side of the wall Comte Horace de Choiseni in particular has conduct esting experiments of this sort on his estate at Viry Chatilion in the Depart Chatilion in the Depart ment of Scincet Oise and has obtained some very promising resuits He built a glass wall 6½ feet high and about 60 feet long extending in an east and west dire tion and

and west direction and planted fitters pear trees of the variety planted fitters pear trees of the variety planted fitters pear trees of the variety planted fitters of the pear to the pe

age weight or about 11 clinoses
Another experiment with glass cepalier wails has
been made by MM Croux & Sons in their nursery at
Val d'Aulony in the Department of the Seine The
wall which they constructed also lies east and west and consequently presents northern and southern ex

posures As the ac om par yir g photographs show par yii g photographs show the wall is surmounted by a glazed roof projecting on each side Along ea h fa e of the wall were planted Calville apples Wi Doyen Passe-Crass Winter and Directrer Aiphand pears together with pea h s and grape vines being taken to place trees the same varieties on ea h con parison easy a d a u

In 1907 these trees and vines produ ed their first crop in which no differ en e bets en the fruit prodused from the north and so th sides of the wall o id be de e ted. The same result as shown by ame result as shown by ro s of 1908 and 1909 There is indeed little

diff ronce in temperature between the north and between the north and south fa se as he former is heated by the solar rays with h traverse the g ass and its latter is cooler than the so th side of a masonry wall for the very reason that some of the incident solar radi through the glass and consequently less is reflected and absorbed. This difference in absorbing power how the class wall inferior to the masonry wall and absorbed This dimension is absorbing power how were makes the glass wall inferior to the mascarry wall in the matter of warming the plants and protecting them from frost at night. A masonry wall absorbe a great deal of heat during the day and gives it out at night but this effect is comparatively small in the case of a wall of gines

In the matter of cost there is little difference be-

A GLASS ESPALIER WALL GOVERN STREET

twen the glass as d the masonry walls. The cathedral glass o phoyed by MM Groux costs about \$8 or \$7 per linear yard of wall \$ feet high including the cost of the glassed roof projecting over both sides. A masonry wall of the same height would cost \$6 or \$6 per and the addition of the glassed roof which of course in the country in this case would ruise the total cost to \$6 or \$7 per linear yard More extensive and (eng continued experiments most be made however. before it will be possible to pronounce a positive ofin ion concerning the relative merits of glass and ma

" BRANCHE MUTIES IN CETAS.

RUFUS PORTER AND HIS "FLYING SHIP."

BY C. E. McCLUER.

Soon after the Montgoiffers invented their first "hot air" balloon, which was almost immediately followed by the first 'gas balloon, the attention of scientists and inventors seems to have been centered on the and inventors seems to have been centered on the spherical and slongsted gas bag as a means of flota-tion, and the provision of propellers and rudders to cable the narigator to control the movements of the unwieldy end wind-teged sphere, and produce what is now known and briefly described as a "dirigible" balloon (Dutting ail reference to the work of the many accomplished and venturesome balloonists who originated or copied the various devices which they adopted for the guidance and management of their spherical or pear-shaped, or elongated and cigar-shaped gas envelopes, we will revert at once to the

subject of our sketch
Rutus Porter, belonging to that numerous class of
ingenious New Kinglanders usually styled "Yankee inventors' was born at West Boxford, Mass., May 1st,
1782 and died in New Haven, Conn, August 13th,
1884 Although he received only a common district

varying success, his journalistic enterprise was per-chased by the present proprietors of the SCHRYLING AMERICAN

iong Porter's less noticed inventions, and the one Among Porter's issue noticed inventions, and the one from which I presume he reaped the smallest recompense, was a figing machine, or as now styled, a "dirigible" balloon, but which he dubbed an "aereport." As nearly as I can ascertain from the records at my command, this invention was made and pat-ented in 1830, but not until 1852 did Porter seem to make any serious effort to exploit the device. In that year he organised what he called "The Aerial Naviga-tion Company," and attempted to raise the funds neces-sary to enable him to construct his first seroport by may to enable him to construct his first aeroport by an appeal to popular support through the sale of \$5 bonds or certificates.

bonds or certificates.

Among the papers of my deceased father I have recently found one of these bonds, issued to him under
date of April 28th, 1852, a facaimite of which is reprinted berewith

Below follows an abbreviated copy of the "proposi

not exceed \$25 per day it is necertained by a misself and careful estimate that an acroport 150 feet long and capable of carrying the persons at a speed of sixty miles per hour, may be constructed for \$1.500. Now, having been disappointed of the finder registate to put this invention in operation on a seale of pre-tail utility; I propose that if three bundred persons that utility; I propose that if three bundred persons whole amount of 1,500 dollars shall have been subserted. I will northwith construct this pioneer serve-treat. I will northwith construct this pioneer servewhole amount of 1,600 dollars shall have been sub-erribed, I will forthwith construct the pioneer sero-port, (which may be done in air weaks), and when this is put in operation I can readily command the requisite funds for constructing a large seroport as above men-tioned. And I will searcrass that each subscriber on the payment of the said sum of five dollars, shall be fur-nished with a requier title deed, which shall estitle the belief thereof to one three-hundredth part of this the source increas to one three-nangreous part of this first aeroport, and also to one three-thousandth part of the first large seroport that shall be constructed, and of all benefits and emoluments that may be de-rived therefrom for twenty years, the said seroport

school education, he possessed an aiert mind and a neientive memory, which, coupled with a natural genius for observation and invention, fitted him ad nirably for an active and useful life. He early dissed an alert mind and a played inventive abilities of no mean order, as is at tested by the list of his patented inventions disclosed ords of the Patent Office Some of his patents displayed an acumen and foresight which ied him into the van of progress, and proved that he was fully abreast if not actually shead of his time. Among his numerous patented inventions we find enumerated a cord making machine a steam carriage or ordinary road robics, prophetic of the latter day automobile, a ploneer treadmill horse power machine, a corn sheller, the inevitable Yankee churn, a washing machine, a signal telegraph, and a municipal fire-tarm system, the latter doubtless being the forerunner of the largely adopted and efficient Gamewell fire-slarm

system, now so largely in vogue.
in 1840 we find Porter as editor of The New York Mechanic, the first purely scientific newspaper pub-lighed in the United States. The next year it was re-sloved to Boston and the title changed to The Ameri-Mechanic in 1845, evidently not having made a nunced success with the publication of The American Mechanic be returned to New York and began the publication of sucther journal which he styled "Scientilic American, the Advocate of industry and Unter-prise, and Journal of Mechanical and Other Improvements, on a cash capital of \$100. The first number of the new periodical was issued on the 28th day of August, 1845. After six months of struggle, with tion and prospectus" alluded to in the bond, as I find it printed in the issue of the National Intelligencer of March 19th, 1852 "THE PLYING BRID"

"A chance to secure a cash income of \$10 to \$30 per week for twenty years by the investment of five dollars in advance

"It is extensively known that the undersigned has by theory and practical experiments so fully demon-strated the practicability of serial navigation that all who have fully axamined the subject are convinced, and no person, even of those whose interests and the person. And no person, even of these whose interests are deverse to its success. Can offer a word of rational accument against it. Several model mashines have been constructed, and each of them has operated as made and one of them, datters het long-cried a small stoam segins, by the power of which the manchine was proposited, and, being guided by the machine was proposited, and, being guided by the machine was present or wind, in direct times or circles, according to the adjustment of its helm. This machine was very an examinated and adjusted by hundridge in law? For windleston and notions thereof were published in several Boston and notions thereof were published in several form those several contracts. who have fully examined the subject are convinced, Boston and notions thereof were published in several newspapers of these cities at the time. Since those experiments were made the inventor has made additional improvements whereby the invention is not perfected. And it appears certain that a sate and curried serial sails (or surroport), capable of carrying one hundred and fifty passwapers at a speed of intely miles an hope, with more parter sailey than either incanteau or railread carr, may be oncertered and fifty in the sail of t to be kept in repair without expense to the share-holders. . Washington, March 18th, 1852. Rufus

holders. Washington, March 16th, 1852. Rutus Forter."
While with the solids knowledge and experience of a hilf century we can see wherein Forter was mistaken in his calculations and visionary to a constitution of the control of the present day, had be but been in possession of the present day, had be but been in possession of the general control of the control of

Scientific American

INITATION MARRIE

A simple method of imitating marble with all its beautiful vein markings spots, and irregular lines and variable colors, is as follows

ne skill in giving the veining, etc, to the produ will be quickly attained by making a fow small stake in a plain way previous to undertaking the production of a larger number The colors for the veining must all be of a mineral character, as follows plumbago (black lead), chrome green (dark), common crocus,

INITATION WARRIE

yellow other, red oxide of iron, and ultram wa few please of stout sheet glass, say 7 luches by 11 inches (an ordinary 11x14 photographic noga-tive cleaned and cut in halves is just the thing) tive cleaned and cut in harves is just the thing)
Make a wooden frame of ½ inch board, an inch dep
with a division in the middle, simply held together
with i inch iron brads not driven firmly in Leav
an eighth of an inch projecting so that they can be easily withdrawn with a pair of pilers. Arrange these strips of wood, after being smoothly planed all over, so as to give two squares of five inches internal

Make up the following in a bottle Paramu wax, 1/2 Make up the following in a bottle Parafin wax, in ourse, beginn, it plint Pince this, well ereds of a warm room to dissolve, ald this by shaking it out a standard when the parafin is dissolved it is ready for use. Brush some of this preparation all over the incide of the wooden panel Then take a plove of Caston fannel or soft rag, well it with the bentite manner of the property o glass plate, polish it thoroughly with two pieces of acft rag until there appears to be nothing left and sort rag until there appears to do nothing lett and place the frame npon the glass plate Now lay a mirror, or a piece of plain slivered glass npon the work bench, or table, and place a hlock of wood at each end so that the glass plate and frame will rest each end so that the gissa plate and frame will rear about four linches above the mirror the frame be-ing held in place by a couple of rubber bands. Place a teaspoonful of chrome green in a small sauver and a teaspoonful of black load in another sauver and add a dessertspoonful of water to each

Mix the following in any suitable vessei (a small stoneware pitcher being well suited) To ten onneces of water add anfilcient plaster of Paris to make a mixture of the consistency of thick cream Skim off

the air hubbles and any dust that may float on top, when in the course of a minnte or two the plan course of a minute or two the place or must be poured carefully into one side of the square on top of the glass plate. Fill this nearly half way. Pour the remaining portion into the other square. Now dip a small brush into the mois-tened black lead, press it through tened black lead, press it through the soft plater and paint the plain or signess veining or spots. The platers blends beautifully with the color and the mirror enables one to see the affects produced. Any line made too strong or lumpy in appearance can easily be rectified by a light stroke or the brush

by a ngat groups of the orman Green streaks or veins may be A EFOHEZ-LI painted with the same brush after washing it quickly and dipping it into the chrome green. Treat the other square in the

same way. Raving now produced the velating, the block may be refindred as follows; Have ready to hand a few pieces of gardenided two needing. Out a piece of the piece of the

small quantity at a time, pour the mixture upon the plaster and wire netting until the panel is filled. Treat the second square in the same way, allow the whole to stand for an hour, until both plaster and cement have become quite set. As soon as all has becement have become quite set. As soon as all has become well set, fraw out the brads with a pair of pilers
and remove the woodwork carefully This will
hasten the drying Take care not to shift the cast
hlocks upon the glass plate Let them become quite
dry while in contact. When dry the colors will not
have more than eachited as brillings and have more dry while in contact. When dry the colors will not be more than one-third as brilliant as when wet, the effect beling precisely like markle. The face of these blocks will possess ever smooth surraces with only a partial gloss upon them, beling at the same time porous. The porceity can be stopped and the gloss much improved by the use of amylacetate colloiding. This is improved by the use of amylacedate collodion. This is practically a solution of gun cotton in amylacedate which not only fills the pores of the plaster, but forms a coaling as clear and transparent se water. It resists the action of weak acids and alkalics and can be washed with water and a chamis leather at any time without injury to the object it covers. When the access expression of the control of the control of the covers when the course we want to be controlled to the covers.

When the squares are perfectly dry and slightly warm they must be placed in a plate or large saucer, containing a mixture of amplacetate collection and one third amylacetate This thin collodion will penetrate the pores of the plaster for a quarter of an inch or the porce of the plaster for a quarter of an into to more in a short time. Remove the square and stand on one corner to dry in a warm place. When dry a couling of the thick amyfacelse rolledion may be brushed upon the surface and allowed to drain from the opposite coiner. The arriace will improve in brightness with every coating. Amyfacelate colledion costs about two dollars per gailing at any wholesale chemists. A stailon will go a long way in waterproofing such also for inflation markins as here dewribed

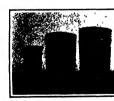

A much harder material with a slight grain can be A much harder material with a slight grain can be produced by niking a small quantity of ground pum ice or ground glass with the plaster which must be infimately mixed to insure uniformity. This mixture is sometimes termed Parian count in mitation markle blocks can be made by the above process into any shape such as a keystona for a mantelpiece or circular shape such as a Reystuna for a mantelpiere or circums with an inhald border and in many other ways that will suit the taste of the individual worker. In place of Porlland cement, Parlan coment may be used as deor Portions cement, Parisis content hay be used as de-wribed above, thus producing a sish of an almost uni-form color. Any sixe of sish may be made as described Of course the thickness must increase with the size of the sigh to give strength

SOME CURIOUS CHEMICAL GROWTHS

BY ALFRED P MORGAN

The following experiments are somewhat out of the ordinary but may be performed with the materials at hand in any chemical laboratory, or obtainable at a well-stocked drug store

well-stocked drug store
in the first experiment mercury is prepared by
throwing into it small plexes of clean metallic sodium
the sodium will aiment immediately take fire and
have a hard crust on the surface of the use rury
Freick thic rerust with a glasser out and sid it in the
mercury until it dissolvers. The little gill bottle on
the right in the lituarisation contains also which event meters of mercury having sodium dissolved in it. The tumbler on the left shows live cubic centimaters trans formed into 'ammonium amaigam,' and occupying a space over fifty limes the original volume of the mer-The transformation was brought about by

PLANT-LIKE GROWTHS DUE TO CAMOTIC

throwing the mercury into a tumbier containing a throwing the moreury into a tunnier containing a strong solution of sai ammondate in water. The mercury immediately swells up into a spongy mass. The time clapsing between the moment when the sodium analgam was thrown into ammondum chloride and the taking of the photograph fituatrated here was about thirty seconds.

The reaction may be represented as appeared dissolved in Hg) and NH₂Cl = (NH₂ dissolved in Hg)

ation of the mam, it is seen to be very

spongy in nature, and its growth in all probability caused by the evolution of a gas. This is indeed the true explanation of the phenomenon. The NH, of ammonium chloride dissolves in the mercury but se menon The NH, of the the mass decomposes, and bubbles of ammonia and bydrogen gas cause the enlargement.

In a few moments the mass will begin to sink, and a strong smell of ammonia will be noticeable. If a lighted match is held over the amail bubbles arising from the liquid, they will burn, lighting with the "pos lndicative of hydrogen The mercury will soon r turn to its normal nal condition, in acco

2 Nil, dissolved in $Hg = 2 NH_s + II_s + IIg$ There can be no doubt that the NH, is actually pres-There ian be no doubt that the NII, is actually present in solution in the mercury, for when a sail of an monium is docomposed by observoyers, he NII, ion monium is docomposed by observoyers, he NII, ion on SII, is formed. But if a post of mercury is used as the negative electrode the NII, dissolves in the mirrory and forms an aeatigan with II illowiver, during the formation it swells up and gives off the products musticende above

GROWTH OF ALUMINIUM OXIDE ON A TRIRPHONE

The most interesting point about this experiment is that it is in accordance with the theory that ammon lum would have the properties of a metal if it could be isolated for excepting this substance the metals themselves can only be dissolved in mercury

The second photograph is an illustration of an ex-periment depending upon the peculiar property of aluminium amaken

The action of sulphurk and nitric acids upon ordinary aluminium is very slow because the metal re-ceives a coating of aluminium hydroxide and is shielded from the acid, but if the aluminium is amai gamated with mercury, the action is very rapid

Aluminium has a very great affinity for exygen, and will display all the metals save magnestum from their oxides if a mixture of aluminium powder and ferric oxide is placed in a crucible, and fired by means of a place of imming magnesium, a violent reaction takes place enough heat being produced to leave the iron, which is one of the products in a highly motion state. This is the principle of the "thermite" used for weld Ing, etc

F: O. | 2 Al = Al.O. + 2 Fe

Some idea of the speed of reaction and the heat gen-rated may be gained if three small iron crucibles are erated may be gained it torce small from crucibles are placed in a villent column, one above the other and separated five or six in hes. A mixture of aluminium and ferric oxide is placed in the top crucible and in-lified. Almost immediately moiten from will melt its way through the bottom of the first crucible and pass way through the notion of the first crucine and pass through the second and third as if there was nothing in the way. A box of saud should be placed beneath the bottom crucible to catch the motion metal.

The affinity of ainminium for oxygen can be shown

by smalgamating a piece of the motal with mercury. The surface is simost immediately oxidized and the result is a growth of white tufts of simminism unide over the surface of the metal where it has been amaignmented. The growth will rise about one eighth of an inch or more in five minutes.

The easiest method of analga-mating the aluminium is to dean a small portion, and then drop upon ne men urk nitrate soluti and allow it to dry The growth will immediately consumue

to the illustration, the case of an aluminium backed telephone receiv or has been used for the experiment, and the resulting growth is shown by the white spots, principally on top at the left

The third photograph is a striking illustration of osmotic pressure. The tall plant like growths may be formed by throwing small pleces of any of the fol ing crystalline chemicals ferric nitrate copper thior ing crystalline chemicals form altrate copper infor de cobair intrate, nickel sulphate and manganess sulphate into a beaker gines containing a diluted soin tion of sodium silicate of 11 specific gravity. The crystals will almost immediately sprout up his vari ous fantastic shapes, and grow several in hes in the e of a few minutes.

The celts dissolve in the water of the sodium alli

A SPONSE-LIKE TRANSFORMATION

cate solution and react with the sodium silicate to form a silicate of the metal of the salt added. For instance in the case of copper chlorids copper silicate

is formed

(uCl, + Na,BlO, = CuBlO, + 2 NaCl

Bilicate of copper is insoluble and so the result of

the reaction is a small portion of liquid around the

trystal of CuCl, surrounded by a sack of insoluble

CuBlO where the copper chloride has come into con tact with the sodium ellicate

Particles of a dissolved sul stance exercise a pr similar to that of a gas explained in physics texts under the title of the kinetic molecular hypothesis

n the sa k is first formed the pressure is equal on both sides but as more of the copper chloride dis-solves the pressure on the laside of the sack becomes so great that it hursts at the ten where the hydrostatic

so great that it hursts at the top where the hydroetstic pressure of the liquid is least and the sack weakest. The liquid spurting out of the top is immediately surrounded by a new sack and the process continues until the sait is exhausted or the growth reaches the

urface of the liquid

The silicator of the metals of the saits mentioned in the fist above ere also insoluble and the same expla-tion holds true for their action

WIRELESS REPERIMENSA WITH A SPACE

EACHIE NY N NY N NY 1 AND N AN. In the large quentity of literature on wireless telegraphy practically the only method described of pro-ducing the high tension corrects required is that of ouring the algorithms of the color ending the first of using a powerful inflation coil or e high tension transformer on an alternating current. The possibility of utilizing the discharge from a direct generator of static electricity is barely touched upon. In order to t at the practicability of the use of such a source of t at the practicability of the use of such a source of current the writer constructed a static machine of the Wimsharet pattern and made some experiments with it. The machine a photograp to which is shown herewith was fitted with two glass plates levels; inches in diameter supported on a half line his inches in diameter supported on a half line his shart. Each plate had thirty sectors of heavy tinfoil 3½ inches long. The brass work was made from 316th round rod and the brass belis

on the collectors and Leyden jars were pur-chased from a manufacturer of brass bed steads as were the large balls terminating seeds as were too large balls terminating the discharge rods and the sending device below. These balls were filled with crushed tinfoli and contact made by inserting the supporting rods in wooden hushings fitted in the necks of the balls.

in the necks of the balls

The two Leyden jars showing at the front of the
machine were made from hydrometer glasses provided
with feet and each had a combined inner and outer
coating of 65 square inches of fell The interior out coaling of 65 square incluse of foil. The interior coal ings were erranged to be connoted with the discharge rods hy short loops of brass chain and the exteriors joined with a similar chain isld elong the base of the joined with a similar chain isld elong the base of the machine. The device shows attached to the front support is the key by which the spart is thrown into the serial and ground and the messages sent. By pressing the lower lever the recking arm above it with a supports the two insulated balls is pulled up-ward, and the latter are thrown into range of the spart more the clus large balls. One of the key balls ground such as a gas or water pipe. I found it best ground such as a gas or water pipe I found it best to allow the acrial ball to take its charge from the positive discharger. By pressing the key for longer or shoit I intivals the dols and dashes of the code are easily obtainable

are easily chialanable. An arrial was rived on my roof at a height of 65 feet above the grund consisting of two horizontal coper wir a supported on twe-foot apreaders with lada (ff nar the cuter running to the edge of the foot where thy acro Joined and a single who led the ne to the nachate on the third foor. This serial gave a wave Penth of about 12 meres. O'ling to the extr nuty high tension and wanescent nature of the dicherge it was ne searcy to insulate the wires with x at care which was done by any porting them in par and 1, Jakes those. The machine as constructed gave

a solid stream of bright twoin h sparks re sembling those from an lidue tion oil when from
tion oil
the large its
balls the jars uncon nected With the letter in cir cult in the neus manner a very powerini spark of about the

was obtained at intervals. With a large bell on the right hand rod and a small one on the left, a much thinner and more frequent spark from five to skx inches long appeared. The first experiments in sending messages were con-

ducted with the receiver in a room about thirty feet away from the machine, using a gasoine ground and

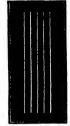

Fig 1 -- CRATING WHICH GIVES THE COLOR

no receiving aerial. A number of detectors were con structed experimentally in leding a coherer and de-coherer with a X junch gap filled with nicled silver filings a microphone consisting of a piece of hard pentil lead bridgap two steel needles a bare point electrolytic and a Marconi magnetic detecter. In all tho tests made the coherer gare the best results at short range and the microphone the best for longer distance: Indeed the sounds were much cleaver in this case then when the electrolytic was used the title latter is considered the most sensitive of all

Fig 8 -DIAGRAM EXPLAINING THE COLOR ILLUSION

in these experiments a home made relay of 200 ohms resistance was used with the coherer and a pair of 75-ohm ear phones with the nicrophone In the experiment conducted in the near hy room the straight experiment conducted in the near hy room the straight expert from the discharpe bills was used and specific are discharge shall was used and specific are discharged to the control of the control being to a water pipe. The signals were nection being to a water pipe The signals were the control three hundred yards no result was obtained with either reveiver although the serial was extended to a length of the control of the c of thirty foot

r to increase the power of the spark the inner coatings of the jars were connected to the d chargers the outer coatings still remaining unc

By this arrangement a shorter thicker a By this arrangement a abortor thicker and more first interest to the key balls which while not as frequent as in the former case was sufficiently continuous to easily permit sending distinct data and dashes when the machine was driven at a slightly higher speed. The mitrophone now responded clearly when the key was worked aboving the in crease in self-citing of the new arrangement and a more than the continuous properties of the continuous productions appropriate the continuous productions are produced in the continuous co receiving station including increpance temporary celver inning coil batteries, sic was transferred to a house three-quarters of a mile away and a receiving aerial erected As the owner of the house objected to the use of the roof for this purpose I was compelled

STRONG STRONG STRONG STRONG (CONCORDED From page 21.) trifugal force affected by the band, causes

the ball to everte faving its flight. In the operation, through the hand is re-valved, the drum upon which the ball justs in the plan or one is stationary. This device is brought into action when it is destrict to give the ball is "spin." There is a groove in the drum in the plant of the state of the state of the plant is a proven in the drum in the plant is presented in a carried to the same points as the "swerre" pulleys. For imparting a ours soin to hall to sweeve during its flight. In ried to the same points as the "swervo" pulleys. For imparting a pure spin to the ball, the pulley rotating the hand as above described is thrown out of action, and simply the drum in the pain upon which the ball rests revolves during the which the ball rests revolves during the travel of the arm on an axis parallel with the drum and at right angles to the line of flight instead of revolving on an axis parallel with the litte of flight, as in Che sotien to produce swerre. If desired, both actions can be brought into use at the same time, and then the ball is given a compound or refractory gyration—combination of swerve and spin—which delivery puszles the most accomplished betsman because of the erratic and con-

batman because of the erratic and con-stantly varying rotary axis of the ball.

The device is aptly suited for practi-ing purposes. The relocity of the ball can be altered at will, and there is a "relocemeter" mounted on the machine to indicate the exact momentum during flight. The veriations possible are very ensive, and no two successive balls ad be delivered alike, the change being seted without the batsman being aware effected without the balman being aware of the fact, or if desired a certain type of delivery can be repeated as his Every gyration can be adjusted as desired, and indeed it is possible to mechanically re-produce the deliveries of any particular bowler The "break." i. e., the tangent to right or left produced when the ball to right or left produced when the ball strikes the ground, is measured by a graduated sight, which also indirectes the swerve of the ball to one side or the other during flight Similarly, the ball can be made to leave the "hand" at any point of the arm's travel, here being a series of stops to secure this end In this series of stops to secure this end in this manner the pitch of the ball, that is the distance from the machine to the point where it comes into contact with the ground, can be easily varied, and similarly the balt can be made to strike the ground in such a way that after the im-

act it shoots forward at great speed The machine is mounted on telescopic ggs, and the height of the delivery of legs, and the height of the delivery of the ball can be made to coloride with that of any bowler whom it is desired possibly to instant, the variable range being from six to eight feet above the ground. The mechanism is also arrandom arm can be pointed in any direction without moving the body. The arm is brought to the horizontat position by means of a lever, by which it is also trained and released to sure to be released to sure to be been the coloride to t

MONARCH LIGHT TOUCH

This exclusive feature of the MONARCH Typewriter should interest the ess men, because of its distinct commercial value to him; it means MONARCH operators are able to produce more work in a day

To the operator, MONARCH LIGHT TOUCH means an even day's work and "No 3 o'clock Fatigue," owing to the fact that it is so much easier to operate than any other typewriter.

We welcome the opportunity to demonstrate this and many other MONARCH advancements, and solicit correspondence from those

The MONARCH is made in regular carriage and several wide carriage models—all shown in our literature which is gladly sent to all who write for it.

"THE END OF CANNONISM"-

An authoritative and powerful summing up of the remarkable development of the insurgent movement in the House of Representatives since the opening of the last Congress.

Congress.

History has been making fast since Success Magazine's remarkable fight last March. The revoit against the House machine was then far from etrong. The attempt te crush it brought Cannon, Aldrick, President Taff, Tammany Hall, and nearly rester as a extraordizary alkinos. Ever since that critical period the movement has been guing etwagth. Cannon and its machine appear to be doomed.

The whole inside story of these recent developments, with a forecast of the preparation of t

with the mineral which under the fric
tion of the bare fact has a most brilliant
polish and is dangerously slippery ex
cept to the active mevements of the

miner
The graphite is excavated by quality oruse tools and instead of being believed to the pit month by role and rull y is loaded into tall baskets of nativ nanu leaded into tail beakers of native name facture resembling small harr is loaded on the shoulders of the native who car ries it bedily up the long ladder to the pit mouth As a result in a busy pit there is a constant endless train of as cending and descending natives bearing their baskets swarming up and down like

their bankets awarming up and down like files their bodios covered with rlumbago brightly polished giving them it ap-pearance in it samlight of moving fig nrea wrought in bright steel Should the pit become flooded a simple system is adopted A rule conduit formed of kingths of wood placed diagonally together so as to afford a V chan nel is improvised which leads to a lower ievel a small orifice being bored through the side of the pit if necessary to secure
the outlet. The water is baled out by na

tives equipped with small vessels

At one or two of the pits where the At one or two of the pits where the wries are abnormally thit some, pre times to modern mining methods is made the water is removed by the aid of sizem tumps and the native article are it imps and the native article are it is a size of the property of th

ness of twelve in hes
Owing to the heavy demand for gra
phite that ensured as a result of the South
Afrikan war when \$31 per ton was re
alised a plumbago fever broke out among
the natives Su h a price induced indi vidual working and tilicit mining on crown lands Even to-day the latter traf fic takes place Should the mineral be fic takes place Should the mineral be proved to exist on the government prop-erty licenses are dily issued by the anthorities to respectable individuals to exploit the deposits but the natives re-sort to posching. The graphite as it is mined is taken

to the cleaning and grading works. It is first submitted to a preliminary hand se lection all the large plots which are for the most part pure graphic or are associated with pyrites and scientic beassociated with pyrites an i sei-mite be-ing piaced on one side. The six-vas com-prise screens of varying mesh stretched on wooden frames inclined at an angle over which the mineral is emitted from small shailow baskets and then ruhbed smail shailow obsects and then runned by hand the larger or coarser pieces fall ing to the lass of the screen wille the minute particles lass through the meshes This process is repeated several times work being commenced first on the small est meshed acreens. In this manner the dust and much of the frishie loose earth is separated. This phase of the work is carried out by women and children

earried out by women and children Bifting completed the graphite then undergoes leaning. The product being hrought in from various localities may be found associated with other ratter a: h as ironatone or carbonaceous d posits of various descriptions and this detections material is removed by hand. This operation also serves to separate the min rai into two qualities the market price

eral into two qualities the market price of whith averages from \$17.5 to \$300 per ton for the first and from \$0 to \$135 per ton for the second grade. The industry has strained great pros-perity poward of \$0.000 natives being am p oyed in the mining of the article the value of which production considerably exceeds \$5.000.000 per annum. The in accesson \$0.000 for per annum The in dustry is also for the greater part in the hands of the natives many of whom have amassed considerable fortunes since owing to the cheapness of the labor, ample supplies of which are readily avail(Concluded on page 26)

Stop Guessing!

THE old way was to buy coal by weight. You paid for everything that came in the car. Now you can buy coal according to what it will do under the boiler.

Two coals of the same price. appearance and texture do not necessarily have the same heating value. The one containing the lower percentage of extraneous matter is naturally the more economical, because it produces more heat per ton.

If there is a coal that will evaporate more water per pound than another coal-you want that coal.

Pardee is a bituminous coal that has a reputation for doing iust this.

Pardee Coal is all mined in one basin. It's uniform. We employ a mechanical engineer who is at your service without charge.

His duty is to test Pardee Coal to insure its being kept up to standard. This is in the interest of our patrons.

Pardee is low in sulphur and ash. It's economical. We can prove this to you. Write us for any information about

able, while the capital outlay is suitil,
a handsome profit is secured. The indus-try is however somewhat controlled by
the government, which issies an export duty of about \$2 per ton, representing an annual contribution to the revenues of the island of about \$100,000 the island of about \$100,000. The in creasing extension of crucibles in the metallurgical industries, and the result ant increased demand for graphite is re sponsible for the present fourishing con dition of the industry.

Weven Aleminium.

Weven Alaminiams,
Aluminum, as is well known is ex
tracted from clay and it was Napoleon
who styled it the "silver of lay" Pormerly it was its practice to extract it
from the clay with the aid of reforts
More recently the electrical current is
employed for this purpose with marked
success, the cost of producing this value. aucesa, the cost of producing this valuable and by no means fully nillided metal, having by its comployment been very much reduced in 1860 a pound of aluminium cost about \$40 now adays it costs only about 20 cents. Above all other metals, aluminium has the greatest about the greatest with the greatest durable lightness with the greatest durable. bility and toughness It can be rolled, cut and drawn exceedingly fine. This has made aluminium valuable and useful in the textile industries. For many years, woven sleves or screens have been made of siuminium, which have proved indis-pensable in the sugar refining industry Its principal advantage consists in the fact that the aurface of the aluminium, on the slightest exposure to the air beon the singuler exposure it in air be-comes covered with a coating of oxide which is capable of offering almost per feet resistance to foreign infinences such as acids, etc. This is likewise of great importance where sluminium is used in the textile industries.

Aluminium yern made up into faces for ladics' shoes as well as used for straps, promises to ise a feature of the coming season.

It would be quite an advantage to the motorist, states a contemporary, if he could communicate by wireless o kephone with his garage or the nearest repair shop in case of accident. An American inventor who is developing a system of mercator who is developing a system of wireless telephony recently made experi ments with portable apparalus to deter-mine the range of service of the instru-ment. He was able to communicate over a short distance with a garage in New ark, but at a distance of eight miles the ark, out at a distance or eight miles the apparatus failed Apparently wireless leisphony will have to be developed for bayond its present efficiency before it can be of service to the motorial. The chief difficulty is that only a short transmitting antenna can be used, requiring an enormous expenditure of energy to reach a city garage, because of obstacles in the way, such as steel buildings, trace, wires, etc.

The Young Folks—

The Brush knows no class; there is no limit to its usefulness. A tried, proven automobile for less than the cost of a good horse and buggy.

MAIL THIS COUPON TODAY BRUSH RUNABOUT CO. of my copy of the near Break Codes

Think of it-\$485 for the best-built, most thoroughly proven, easiest riding, most economical, handiest small automobile in the world!

FIF NEW BRISH RESAUCE not only out-classes all small cars but is far alread of its own previous high standard

previous right standard to lessons all ununfacturers have to learn by experious—ex-ucil brough we have manifacturing facilities as userly perfect as money and brains can make them—still we could not build a car of the quality of the top Brush if we merely initiated the big cars with all their compleated parts and all parts necessarily smaller and weaker

Here's where the genns of the designer counts The Brush has always been and still is the only real Runabout built in America

The new 1910 Brish is tool a designer's thream but the result of years of experience and a knowledge acquired by manifacturing 3,000 Brushes that are in daily use. It is a car which with one chassic adapts itself perfectly by change of bodies to a hundred different uses.

It is a car new in power, smoothness, speed and looks but built on proven principles by an organization already perfected

The Brush has the fewest possible parts but they are of sufficient size and strength to stand the hardest knocks

SIMPLICITY makes it possible to build the carright and still sell it at this wonderful price.

As for reliability their is no comparison between the British and any of the small miniations of large multiceschinder care.

With the new Brush you get single-cylinder sympletic reliability, high weight low gas-oline and off consumption, how the expenses with four-citinder power and smoothness.

Its new balanced motor runs as quietly as a four-exhider and is as flexible. Its power is

astonishing
The most wonderful improvement in Motor Car construction in years
While the balanced motor is the most remark-

able feature of the 1910 Brush, we have made

numerous other nurrowments and refinements. Here are some of them wheel-has kungthened 6 meles more graceful and rakes hines Mercedes type radiator now selective control numeroal couplings-haft, improved dist-proof committator multiple due low and reverse chieles, transmission control levers entirely loneed and oblight more quint multiple for the proof of the lever of the proof of the levers of the levers

BRUSH RUNABOUT COMPANY, DETROIT MORE AVENUE

THE WHITE GASOLINE CAR is in a class by itself

If you plan to buy a gasoline car, why not get the very latest construction? You can find it only in the White, or in the 1910 foreign cars at double the White price.

The White gasoline car is at least one year ahead of any other American-built machine. Some of the advanced features of the White, which are not yet found in any other American car are:

"Long stroke" engine
No external manifolds
Heated intake
Water-cooled exhaust

Among the White features which are not found in any other American cars, except those of the highest prices, are:

> Four-speed transmission Imported cylinder casting Bosch magneto

The above features, combined in good design with the best materials which money can buy, and with the famous White

workmanship make the White gasoline car by far the most desirable on the market.

We venture the prediction that the principal changes which will be made by progressive American manufacturers during the next year or two will be the adoption of the features which are found *now* in the White gasoline car.

The price of the White gasoline car ranges from \$2,000 for the Model "G-A" touring car to \$3,800 for the Model "G-B" landaulet.

Even if you desire a smaller car or a larger car than the White, it will be to your advantage to inspect the White or at least to write to us for a copy of our catalog, in order that you may inform yourself as to the latest developments in gasoline car design.

THE 1910 AUTOMOBILE

ONVINCING evidence that the automobile of to-day is as far perfected as the ma ti risks of construction and mechanical in genuity will allow, is afforded by the fact that the cars shown in the two annual exhibitions nat that the cars shown in the two annual exhibitions this year exhibit no novilles of a radical character as compared with the cars of the preceding year. Indeed, were it not for the relatively short life and high cost of the tires, the automobile would surely be entitled. to rank as the most perfect and economical means of transportation of the present day. As to whether some cheaper and more durable substitute, having the same resiliency as rubber, will be found during the immediate future, we can only say that there is not immediate future, we can only say that there is not at present, as far as we know, any promise that such a substance will be produced. At the same time, the development of the car has been along lines that are highly favorable to the life of the tire, for both the signly favorable to the life of the tire, for non the weight and the horse-power have been greatly reduced Moreover, the average owner is beginning to under-stand that the exercise of discretion in the use of the in avoiding rough places on the ro slowing down at curves, will add from fifty to one hun-dred per cent to the life of the tires The tendency toward standardization is even more

The tendency toward standardisation is even mor-marked this year than last, and the freak car is ron spicuous by its absence. The predominance of the four-sylinder motor would indicate that this is to be the prevailing type of the future. The six-ylinder motor is being made, but its spice of its acknowledged advantages of more oven torque -ic., it is mainly con-fied in expansive cars of high power. An sensourag-ing feature, based upon thoroughly sound mechanics, at the increased length of stroke, two of the leading form 30 ph. 10 ph inches stroke respectively
indoubtedly, the present dood tide of prosperity b

the automobile industry is due largely to the fact that a multitude of people of moderate means, who have been waiting until a thoroughly serviceable car embodying the intest improvements was placed on the Several makers are offering a four-cylinder 20-horse-power car having all the features of stylish design, accessibility to the parts, and case and certainty of control, of the more costly designs for the low price of \$750 Cars of this type have proved during the past year that with judicious handling they are perfectly well able to stand up under constant and severe service For all cars the four-cylinder, four-cycle engine, with variations in the valve arrangements to suit the tastes of the various builders has become the standard type of the various builders has become the standard type, and the indications are that ultimately the cylinders will be east on bloc. Crankshaft ball bearings have given place to babbit paralist bearings of fiberal area, although a few first class makers are using a modified ball bearing with an outer rotating ring. For axies, although a few still use the balls, the roller be seens to be established as the standard practice

There is a practically universal use of high-tension ignition. All machines down to the lowest priced ere magnetos with either a four-cylinder coll and timer as auxiliary or a dust system of ignition timer as auxiliary or a dual system of ignition. The shaft drive is a immost exclusive use, the chain being retained only on very large care. The transmission, except on the smallest care, is almost invariably of the siding and selective type, with three speeds ahead and one reverse and the excellent results ob-tained by those firms which have placed the transmis-sion's fast, the excellent results and the state of the contraction of the contrac into conered fever

n is effected mainly by two aystems, or

employing "splash" librication, in which the cranks pass through a bath of olf contained in the bottom of the crank case, and the other employing a trough and r pamp, which causes a constant and positive circular into through a wary hearing of trained of a tendency to clarge the size there are no notable changes in the airly mechanism of American oran, and it is rather

varie mechanism of American cars, and it is rather remarkable that, in spits of the increased use which is being made abroad of the silds valve (a distinctly American invention), there seems to be no disposition to develop this type in the land of its birth Although the multiple-disk clutch hids fair to become the exclusive type abroad, the familiar, leath covered cone clutch has rendered such excellent se ice on American machines that it still holds its own, and this in spite of the fact that the mnitiple-disk type

has been giving good results on such American cars as carry them
In the mannfacture of car bodies, there is a marked tendency toward the adoption of straight line designs. Several stylish-looking cars, both of medium and high

, are shown with the much-talked-of torped in which both the front and rear seats are an body, in which both the front the year sears are un tirely inclosed, the cars being provided with side doors, forward as wall as behind. The provision of doors that open toward the front instead of toward the rear is commendable, both from the standpoint of conven-ience and safety An additional advantage of the torpedo body is that it provides excellent prote against the rush of air, particularly on high-speed ed cars. A notable tendency of the times is the growing popu-ierity of wind shields and "tops," the appreciation of serily of white aminos and roys, the appreciation or the former being due largely to the general objection to wearing goggies. The use of tops renders the mo-torist comparatively independent of the weather, and they unquestionably add to the alt-round comfort of touring

The question of the relative advantages of the righ hand and left hand drive is coming to the front, and some makers are offering cars with steering wheel placed at the left of the car Unquestionably the right hand position is preferable in those foreign countries here the rule of the road in meeting and par the opposite of our own There, in meeting a car one passes to the left, and the driver, if seated on the right of the car, is in a favorable position for judging of the of the car, is in a tavoranie position for judging of the mecessary iterature. In this country, where the rule of the read is reversed, it would seem logical also to reverse also the position of the driver. The handsome display of motor trucks forms per-haps the most notable feature of this year's exhibition.

no less than seventeen different makes of comm no less than seventeen different makes of commarcial motor whiches being above at the Grand Central Pai acc. In quality of design and workmanship, and in the variety of uses for which to valicies have been built, this section compared favorably with the best work above in the other automobilis chilbits, and as one passed from onto the another of these powerful makes and noted the executions combination of compact thines and noted the executions combination of compact thines and noted the excellent combination of compact ness and great engackly the impression became strong that at length after many years of discouragement, the motor vehicle had come into its own Certainty the statustics of the trade bear out this conviction, for its estimated that during the coming year about fifty thousand commercial vehicles will be built in this country alone. This gratifying result is the outcome of several years of careful experimental work, in which wholesale houses department attors, angives compan-ies, and the business department attors, and the state of the control of the control of the control of the con-tinuous control of the ditions of traffic, both in summer and winter That the manufacturers themselves have faith in the future of the industry is proved by the fact that, in several or the industry is proved by the fact that, in several cases, they are considerably enlarging their plants to meet an expected increase in the demand, and one firm atone in the West, is to-day in a position to turn cut five thousand motor vehicles for commercial tass

IMPROVED QUALITY VERSUS PRICE REDUCTION 1VE years ago or more, when a man paid \$2,000 or \$2,500 for a touring car, or \$650 to \$1,200 for a ranabout, he scarcely expected to get much in the way of reliability and darabilitymuch in the way of reliability and durability-or, if he did, in the cusberance of unsophistical-a-ticipation, he was pretty anre to be disappointed before the had seed the car many days. The narraitra of an antonobler ran in those days was usually a recital of a nories of revolved or various sorts, chiefly with tires, carboneter, and ignition, but also frequently with the hardsage and imperfect functioning of valva mechan-ism, shafts, evers, rhains, and even setting knuckins, driving axies, and other wital parts.

driving axies, and other vital paris. Conditions are very different in the present state of automotito development, when it becomes a matter of surprise to ever well-posted observers that eight cet of thirty care taking part in the Glidden tour of 1964 about finish an articone trip of 3.460 miles was brown Detroit, Chicago, Misosapolis, St. Louis, Detwer and Kannas City in Riven days at an average speed of twenty miles an houst during the daylight reasting periods, without emileting a chight investment of opportunity of the contract of

for repairs, or for adjustments of his way except to heaten, earborstor, this ignition system, and three. Considering the read and wealther confidence under which the work was done and the last; of diffy inspection, cleaning, and adjusting, this probably proposed as higher degree of redirectory and partversance than can be shown for any other inschantest construction.

struction.

The wonderful improvement in motor-car quality made avident by the results of this test and by a comparison of the specifications of the machines of today with those of machines selling at about the same prices in the early part of the decade now drawsame prices in the early part of the decade now drawing to a close, is due to a 'aumber of contributing causes, but to none more than to the production and use of appeals pracked or Statel, broates, aluminium, and use of appeals pracked or Statel, broates, aluminium, and stated particularly to the requirements in different parts of the antomobile The manufacture of first-clase or even reasonably satisfactory moor cars in the country was practically impossible muit the then small group of amperimenter and builders were able to construct meant amministrative of the large possible construction of the contribution meant amministrative of the large possible productions of the contribution meant amministrative of the large possible production. bilities of the automobile industry, and thereby in them to undertake the production of nickel steel and them to undertake the production of nickel steel and chrome nicks itsel for use in rankshelfur, (rankshelfur, (rankshelfur, terministon shafts, driving axies, silding, differential, and sterring gears, isselring kuuckles, and similar parts, and of manganese bronzes, phospher bronzes, and vari-nos attuministum alloys for use in crankcases, gear boxes steering-gear bousings and similar parts demanding-great stiffness combined with light wight. The autogreat stiffness combined with light waight The auto-mobile industry is very largely responsible for the discovery of the physical properties of chrome-nickes steel and vanadium-chrome steel under different modes of heat treatment, as annesling and oil tempering, and for the introduction of the special tool steels required

Before the special alloy steels were brought out Before the special alloy steels were brought our, the motor-ar manufacturers nearly resched the end of their resources in the effort to produce safe, darable care of satisfactory power and speed without excessive weight. The transformation that has been wrought can be better comprehended when it is shown that it is not uncommon for specially treated chrome-cities in the state of the second o pared with 60/00 pounds totale strength of Brouse inn of a quality used by wagon makers and also employed for certain purposes in automobiles. That is a bar of the alloy steel one lich square is expable for a superior of the steel of the strength of the Tha qualities most sought in metals for alloing scars rankshafts, cannahafts, driving and differential pin-ions and pears and it're rear raties are sistellity to resist torsicional stresses and impact, hardness to restat warr, and ductility to bend under heavy shock instead warr, and ductility to bend under heavy shock instead challeting. as it was found in the earlier dars of the elasticity, as it was found in the earlier days of the industry that the soft Swedish iron and low-carbon Beasemer crucible steel would take a permanent set

under the repeated shocks and stresson, and threw the shafts and gener out of sligmons of steel of such won-derful strought in the sliding-gar sets, by way of II instruction, it is now possible to (ransmit the 40 and 60 horse-power of the modern touring car with smaller and lighter gast sets than were used in cars of 12, 15, and 20 horse-power five years ago, and that with much greatur certainty against breakage and the practical elimination of the smalling of the anis of the teeth by meshing and of wear due to consist under the control of the state of the control of the state of the teeth by meshing and of wear due to consist under of the machine that must sustain heavy torstonate, stresses, frequent and heavy impact, or much friction, the designer has been enabled to keep down the weight the machine as a whole. This secondary the series speed, power, quick acceleration, perfect manages ability, and the dependability and the dependability of the care of today weighing little if any more than mechanes of a quester or third the power and half the speed, built carriage the first half of the densite of the care o

ENGINEERING.

The Pangine railway, which has formed the subcet of illustration in this journal, is making steady progress. About 120 men are engaged on the tunnel between Hismer station, 10,445 feet, and the jungfreat jock, 13,000 feet above the sea level. The present indications are that the read will be completed toward the class of seatz bear.

Al the last meeting of the American Society of Naval. Architects and Martine Engineers. In a paper on "Applications of Electricity to the Propulsion of Naval." A Committee of the Committee of t

En a somet acticle in one of the magnatice, Admirts Draux takes a rather posimitate view of the future of the Panama Canal. He sees but little revenue in prospect, and apparently be bolds the view that, unless the canal be declared free to at navigation, it will succeed in attracting but a limited amount of abhipting He seems to be of the opinion that it cannot possibly charge a sufficient toil, at itseat during the early years of its operation, to pay the heavy fixed and operating charges.

A piese of \$5,000 has boun offered in England for a twenty four-hour aeroplam motor. In weight the engine must not exceed \$46 pounds, and it must develop not less than \$36 brake home-power. The points of the consultance in making the award will be weight, parts, security against fire, and minimum air resistance. The conditions are severe, but unquestionably the motor is the weakpoint in the aeroplane at the present states of its development.

Emphatic termination and the shifty of relationed one crede to relative extensions that shifty at the control of annoved concrete, according to Prof. Amore, proved to bhighy resistant, and much significance was attached to the case of two reservoirs of considerable size, one of brick and the other of crisinformed concrete. The concrete structure received no linjury, whereas the heit's reservoir was complicitly destroyed.

Recently gathered steam turbine statistics, referring to the growth of this new type of ongles in public favor, show that atthough the first steamer was equipped with turbine as eccently as 1901 there are now skitt four vessels carrying this equipment, the aggregate home-power represented being 6000 tit is estimated that because of the lower pressure which can be used with the turbine, no less than 120 tons of weight was saved in the botter room of the largest of the turbine propelled liners

Resistation population lawy many financial formation. Resistation population lawy many out of 105 preventable collisions and destillments, twenty-one of the preventable collisions and destillments, twenty-one of the accidents were due to the failure of the locemotive engineers to observe the signals. Evidently the human element enters harped just to be question of the efficiency of block signating. In view of this fact, it is encouraging to noise the steady growth of automatic stop devices which, in case of failure of the engineer to devy a signal, will open the train pipe and set the

ELECTRICAL

A recent proce report states that a chain of wireless stations is to be established by the British Admiratly in the Pacific Coan. High-power stations will be placed at Sydney, Doubliess Bay, New Zealand, Suwa, the capital of the Figl group, and Ocean island with medium-powered stations in the New Hobrides and Soiomen Islands

A new device for connecting wires has just been put on the market it constitute of a silector adjusted on its over the wires, which is filled with a requisitio amount of softer. The silector is formulated with material which when glated produces sufficient has its melt the softer when glated produces sufficient has its melt the softer and firmly softened in this position. The devicer and firmly softened in this position. The devicer constraint of the softened in the position of the position of the softened in this position. The devicer and firmly softened with a match. The advantages of such a system of connecting wires will be appreciated by those who have tried to solder joints on overhead times.

The voltage on power transmission lines has been rapidly increasing, and at such a page as to simust take one's breath away. The development has required a similar aviance in the design of transformers capable of taking the high-tension current and reducing it to a lower and more serviceshie voltage at the points of distribution. The latest transformers of the type have a capacity of 1.750 billowatts, and are capable of taking a maximum voltage of 113,500 and reducing it to 11,700. Those transformers have been built for the Ransiasus Power Company of California Radio Internationary until weighs about 25 tons complete stands 17 feet high, and occupies a floor space of 9% by 5% feet.

For the past three years meet has been circle by selectivity in much less time than was required by the old method. The meet is placed in large wooder tanks and covered with the ordinary pikit. An after nating current of 35 amperes at 35 voits is passed through the vat, the estimations serving to prevent electrochemical action. Carbon electrodes are used, with an avarrounded by porous cups that dip into the brine. The coat of curring a vat full of meet from the country of the current of the control of the current is advertised in the brine current is advertised to the current its distribution, except for the loss of in greedents taken up by the measurement.

According to La Lamieve Silvetrique a new microphone has been constructed by Meware Carl Emer and
J Kannar, of Holmstreem, Sweden, which will with
stand a current of ten in officer amperes. The details
of the instrument are not given out, owing to the fast
at it has but yet been prototed by pateriar. The
Swedish government resoluty connected several telephone lines, forming a line severy insteem and
wary clearly over this circuit, whereas with the or
dinary apparatus no audilies sounds were produced.
The new transmitter is being used in the Pushen
relices telephone system and it is talamed that con
versation has been curried on over a distance of 178
miles, using a high frequency current of six amperes

The Nery Department is giving its extract support to the hill introduced by Mr. Roberts, who is a mem ber of the Hones Committee on Neval Affairs, to conto amateur wireless telegraphy Mr. Roberts s measure calls for a board consisting of seven members, one expert each from the Nary, War, and Treasury departments, three experts representing commercial writesse telegraph and deephony in the proposed that the operations of the analysis of the day, and that each operator be required to take a manufact telegraphers be confined to certain hours of the day, and that each operator be required to take out a license The Nary Department has recently for warded to Mr. Roberts extracts from the logs of revenue to the control of the difficulties with

With characteristic thoroughness the Prumina Gorerment Enlivery have been investigating the best roadbed for their lines, also the best trolley systems and motors. About 30 miles from Berlin is an outshaped experimentar milway of about a mile in length Part of the roadbed consists of wooden ties, and as other part of metal ties. Various kinds of ballest are used, and writton suchoed of connecting the rails and ties. Over this experimental relivery an electric trails the days, and in this way it is possible to determine which form of roadbed will best stand the wear of stund service. The overhead system has been changed from time to time, and different forms of collectors have been used. At present the loomotive on this line is being driven by Winter-Richburg single-piece sees to use motorus mented on the floor of the loomotive, and enable-connected to the driving wholes.

Prof. Ady has studied the ratileactive properties of the many laws, especially toose of Vasuvias. From his results it appears that the Vesuvian laws, from his results it appears that the Vesuvian laws, from 1831 to the present day, are remarkably rich in radium compared with other laws, the values ranging up to three times the normal for ignous recks, and sometimes veen higher than that The thorium content, although large in comparison with what gonerally prevails in the rocks of the 80 Gothard series, is not considered in the vesuvian rocks than in the rocks from other volcances. The highest reading was obtained from the Krakatan pumiler. The Vesuvian bottime from the Krakatan pumiler. The Vesuvian classifier of the vesus of the content of the c

Note ious ago Peri. Turner proved that gold head Not as insuperent shee based in consist with glass. This interesting phenomeno has been during tutled by Messer J. C. Chapman and H. I. Porter without the use of glass. In their experiments a piece of gold leaf was hold by its edges to a platinum loop and heated in a double-walled quarter runtille. As becoming more tank, and the properties of the conbesting continued it was noticed that the gold losf was becoming more tank, and could be considered to a samicing it may be the continued of the contraction of the contract of the contract of a samicing it interesceptically after remeal its strucquent experiments with the leaf hanging like a blind with a weight at the bottom to put it under definite tomaton showed the contraction temperature was nearly with a weight and was about 140 de get. With gold were employed the contraction temperature was nearly the same in all, and was about 140 de get. With gold were instead of leaf no contraction took place the tractic and the contraction temperature with glass is attributed to the contraction to white glass is attributed to the contraction to the contractive case in laterals between.

THE MOTOR CAR AND THE ROAD.

THE DESTRUCTIVE EFFECT OF HIGH SPEED.

BY LOGAN WALLER PAGE

DIRECTOR OF THE OFFICE OF PUBLIC ROADS, UNITED STATES DEPARTMENT OF AGRICULTURE.

The most serious and difficult problem now engaging the attention of highway engineers all over the world is the preservation of the crushed stone road under the of new methods of construction adapted to the require ments of this twentieth century traffic That the auto mobile has come to stay no one will dispute. It is estimated that there are already about 250,000 ma-chines owned in the United States, and the number is and the iron-tired wheels passing over the road from time to time were depanded upon to wear off a suffi-cient amount of rock dust to replace that carried away by wind and water, and this, under the sotion of moisture, recemented, thereby automatically renewing the bond of the road surface. When the road was subbond of the road surface. When the road was sub-jected to drought, the conditions were made normal by regular sprinkling With the advent of the automo-bile, a totally new condition prevails. The rubberthe effect were produced by auction or vacuum, the action of both front and rear wheels should be some-what similar at least. It seems apparent to the writer, therefore, that the read best adapted to moter trails is the read which will best resist this powerful tractive is the road which will best resist this powerful tractive shear it has already been demonstrated that no plata meadam road is capable of resisting this force. While the destruction of the road may be considered as the most tangible and serious problem, the dust

Twenty miles an hour.

Thirty miles an hour

Eighty miles as hour.

THE DISIPTERATING RYPROT OF AN AUTOMOBILE TRAVELING ON AN ORDINARY MACADAM ROAD AT DIFFERENT SPEEDS.

increasing at a marvelous rate. In France, which is credited with having the most superb system of roads in the world, bullt at a cost of about \$625,000 000, a great international Road Congress was sanctioned by the French government and held at Paris in October, 1908 So alarming were the ravages caused by motor traffic on the costly French road system that the purpose of the meeting was announced to be "The Ada; tation of Roads to Modern Methods of Locomotion In the United States, the problem as yet is a vital one only near the great centers of population, for the resson that but a small percentage of the total mileage of roads is improved, and the motor traffic is largely confined to small areas of country, but it will of necessity become increasingly important with the constantly in creasing use of the automobile

methods of construction which have stood every test for more than a hundred years are inadequate to most the conditions of this new form of traffic, and that we are in the midst of a transition period which may eventually revolutionize the science and art of the rose builder The highway engineer of today is called upon to ascertain in what way the automobile injures the road what is the exact cause of the injury, and finally to devise an adequate remedy

When Treanguet, the great French engineer, made his eport to the Council of Bridges and Roads in 1775, h set forth the principles of construction which as modified and added to by John L. MacAdam in the early part of the nineteenth century, have proven adequate part or the nineteenia contury. nave proven sacquate until the twentleth contury. These great road builders and their successors sought to secure a road capable of withstanding the wear of iron-tired horse-draws vehicles, for the motor-driven vehicle had no place in their philosophy They worked upon the theory that the dust ahraded from the crushed stone would fill the volds between the angular fragments and when would serve as a cement, thereby making the road face practically a monolith. The iron-shod horses

duce any new dust from the rock, but the tremendous shearing effect of the driving wheels forces the loose dust on the road into the air in great clouds, and, as the body of the machine displaces a large volume of air, the deflected currents carry the rock dust off the air, the deflected currents carry the rock dust of the noud, thereby effecting a premanent lose of the all-ossential binder. It follows that the road is soon strip-ped of its fass binding material, and the npper or even-ing course of the stone is exposed. These stones, to the stone is exposed. These stones, the orbid of the binding material, are soon isosemed by the great shear of the driving wheels, leaving the road body raveled or distingential I it is, of course, appar-ent that the seriest described are greatly intensified on the stone of the stone of the stone of the stone of the Hilbert and mechalical scripters have ever some much

Highway and mechanical engineers have given much udy to the action of the automobile on the road surface, and many ingenious theories have been advanced.
While it is true that the slipping of the tire, the skidding, the shape of the car body, and the suction of the pneumatic tires all contribute to produce the effect, the most conclusive experiments seem to warrant the assertion that the great tractive force or shear exerted by the driving whosis of motor cars is the main factor matic tires all contribute to produce the effe by the driving whoshs of motor care is the main factor is fairury A series of tests conducted by the United States Office of Public Roads in 1908 produced some interesting results along this limit. Care of various weights and types were un over a measured course at different rates of speed and right-easily pictographs different rates of speed and right-easily pictographs racing, weighing with driver and mechanician about a 1200 pounds, was driven over a strucked or read first at five utiles an hour, such run being finereased at the tot of five miles an nour until a preed of 60 miles was attained. Up to 20 miles an hour little or no effect was attained. Up to 20 miles an hour little or no effect was refriring with such increase in speed, when the produced on the road, but from 30 miles an hour the effect was striking with such increase in speed, when the produced by the rear or driving whesis. If

nuisance as intensified by motor traffic is most far-reaching in its indirect effects. It has been claimed te dust produced by man comes that min-femins of the dust produced by man comes from streas and highways and someone has very apily termed the public road the "national dust fac-tory". The effect of the hugo clouds of dust upon health must be very great, as most forms of disease are transmitted by this germ-laden dust. The damage are transmitted by this germ-laden dust. The damage to crops growing adjacent to the public highway through the dust nuisance is real and tangible, and particularly is this true of small fruits. So extreme has this condition become in certain districts that no attempt is made to raise fruit near dusty roads. Its effect upon some classes of live stock is most severe, cattle and horses in particular being susceptible to the cattle and horses in particular being succeptible to the germs of therefulois carried by the dust. The auti-mobile cannot be held responsible for these forms of damage, but it has indoubtedly intensified them. The road builder is, therefore, called upon its many case to mitigate the dust missance by devising a form of treatment which might be considered a pallitative. The efforts of progressive highway ampliours are di

rected, therefore, primarily toward the preservation of our stone-surfaced roads and the construction of dust less roads, and secondly to minimising or mitigating the dust nuisance. The results so far accomplished

the dust nuisance. The results so far accomplished have been for the most part experimental, and but like attention has been given to the actual composition and characteristics of the materials employed. It is ordinate from even the slightest consideration of the subject that the solution of the problem must come, for the most part, from the highway engineer railbor than the sutmostile manufacturers and the reasor than the autonomies manuscurve and telegistator Manufacturers have, to some extent, tried to reduce the dust-rating tendency of their machines by various mechanical devices. Experiments in England brought out the fact that care fitted with bodies having either very great or very slight clearance raised if dust than those with an average clearance. So novel devices were tried with more or less success,

MOTOR BALLOON GUNS.

AUTOMOBILE VS. AIRSHIP

It is to their credit that the manufacturers of artitlery should so carnestly have grappled with the new problems presented by the development of successful aeroplans and dirigible balloons and so quickly have designed special ordinance to meet the new form of warfare. The firm which has been most settly in this direction is the great Krupp Company, in having brought out several types of gun, capable of firing at the high angles which will be necessary in order to hit the rapidly moving airships and pis future Because of the extreme mobility of the new ethod of attack from the

air, it is obviously occursary that the means adopted to resist it shall is capable of a correspond is capable of a correspond ing mobility. This is especially true where the warfare is likely to be car-ried on against more or tess rapidly moving bodies

Now the automobile be ause of its speed weight, and strength, is particu iarly adapted, not only for carrying light automatic guns but for affording a platform from which they muy be fired with a res sonable degree of ac-curacy indeed the artil-tery motor (ar armorplated and carrying a gun that is locked firmly to its chassis, is the natural counterpart of the familiar armored train run ning on the rails of the

And although the military regular steam raliroad automobile will be largely restricted to the roads, and will leave them only under exceptional conditions of smooth and fairly level country, the automobile bal-ioon gan will find a field of neefulness in futurs campaigns whose limits can only be determined by the hard experiences of a regular campaign.

Of the three rapid fire-gun motor cars herewith e is American and the other two are of Ge man make One of our illustrations shows a rauld fire balloon gun, mounted on an armored motor car of 60 horse-power The latter, in spite of its weight of three and a quarter tons, is capable of making a speed of 45 kilometers per hour and mounting grades of 22 per cent, even when the roads are of poor quality Tim gun is also shown mounted on a semi-armored can This effective weapon has a muscle energy of 248 This effective weapon has a muzzie chergy of 248 meter ions and an outrome range at an angle of 48 degrees of 7,800 meters. At the maximum slevation of the gun, the shell has a maximum height of trajectory of 8800 meters.

oring of the motor cars consists o steel plates, 3 millimeters in thickness, and the gun liself is provided with a special shield capable of a wide are of siming The wheels, also, are covered

atcel plating The emmunitien. 1. carried in a box undernesth the back seat, and it will be noted that the front of the car is provided with silts for rittemen

The guns are provided with shells of a spe-cial design, suit able for attacking the gas bag of a dirigible or the caovas or rubber-cloth covered surfaces of an aeroplane To assist in tracing the flight of the shells, they are furnished, at the base, with a substance which is ignited at the

instant of firing the gun, and emits a distinct trait of smoke during the flight of the shell. This gives the unner some indication of the error in his sighting But it will be a very difficult matter to more upon

a fast flying machine speeding mile-high above the earth. The most promising form of attack is with shrappel, which, if hurst at the right distance in front of the object, will envelop it in a perfect spray of jagged shell fragments

other illustration shows the McClean-Lis matte rapidifica gun as mounted on a Aton Parkard

ing, for that State will make 113,000 of the total production of 302,000 cars scheduled for 1910. Four one-tion or 307,000 cars sensonine for 1910. Po75 machines. Other States adjoining will contribute 70,975 machines. The Middle West may therefore be said to be the real home of the automobile fudure; Illinois is exheduled to make 18,300 cars in 1910, Indiana, 21,025 cars, Ohlo, 22,750, and Wisconsin, 11,000 In the East, Consection will make 2,100 cars, Manaschusett, 4100 cars, New York, 10,400 cars, Pennsylvania, 3,250 cars, and Rhode Island 800 cars.

These figures are taken from statistics obtainable

in connection with eighty of the prominent auto-mobils companies, and are startling to say the least, both as to their bearing on the location of the motor car industry, and on the importance of the au tomobile industry as a whole In addition, it must be remembered that there are fifty other firms making 100 cars or less, with 150 makers turn ing out a few cars or experimenting

Just why the middle

car manufacture is worthy of some consideration, especially when it is re-membered that much of the early experimenting in motor cars and early manufacturing was done at plants in Buffalo and Tarrytown, N Y, Marlon,

TATTION. N. Y. Marion, T. M. Marion, T. M. Marion, T. M. Marion, Philadelphia. Ps. and other Esstern States. WHAT THE MOTOR VEHICLE IS DOING FOR THE FARMER.

BY WALTER LANGFORD.

Less than five years ago farmers generally looked upon the automobile with bitterness and condemned it as a "toy of the rich". To-day, there are farms com as a "toy of the rich " Yo-day, there are farms com prising hundreds and even thousands of acres, on which nearly all of the heaviest work is done by motor vehicles. There is hardly any part of farm work that cannot be done more quickly and with greater satisiuxnry and time-saving ability of the motor car He balances off the cost of a tenth or a twentieth of a gallon of gasoline per mile traveled against a third or gasion or gasoline per mile traveled against a third or half bushed of oats a day at 65 cents a bushed, whether the horse is working or is standing in the stall on a rainy or a winter day, and reckons the time saved to himself as mainly pure gain

rean, high clearance above the road, a thoroughly pro-tocted engine and transmission, reasonable price and low fuel consumption and maintenance cost have con-tributed toward making this model popular with the rural buyers. From the statements of hundreds of users, it is found that the average cost of upkeep is not more than two-thirds that of keeping a horse. The

MINITER RIGH-WHEELED MOTOR WASON CARRYING A LOAD OF PARM PRODUCE.

CARRYING CRAYED OF OTHER AND ROOM TO MARKET

faction by the use of motor power-either applied to e self moving machine or in the stationary form— than with horseflesh. Whether it is making a quick trip to town with a load of butter, oggs, fruit, or veg trip to town with a load of butter, oggs, irus, or reac-tables, to the creamery with the evening's cane fresh milk, to church with the family on Habbath morning, doing the spring and fail plowing, cuttivat lies. resping threshing—the motor vehicle in its ing, reaping threshing—the motor vehicle in its varied forms has become the latest ally of the pro-

greenive prosperous farmer it has been a matter of general knowledge and com mon comment in automobile circles that extraordinary

mon comment in automobile circles that extraordinary numbers of motor cars have been going into the remote sections of Kanasa. Nebraska, Minnecota, the likelotas, Colorado, and even Montasa. Okionosa, and Parsa during the past season. The statement has been made by a man Heemitde with the trade and presumed to be posted that fully one-quarter of the purchase of motor cars west of the Minsistapi during the season of 1969 were made by farmers, and this means a good many when the combined output of the manufacturers of the country for the year ag soom early the little communities in the Middle West, with a population numbering only hundreds or at most a few thousand inhabiliants have begun to be sout of passessing more motor cars in proportion to population than any other city or town in the country, and tion than any other city or town in the country, and to prove it, they congregate all the cars in the village

in Main Street and have a group photograph taken The farmer, who has long distances to go for everything, from a keg of nalls to a paper of tobacco, as works early and late to make up time lost partly in going "to town, has not been slow to appreciate the Scattered all the way from the Atlantic to the Pa-cific coasts there are small fruit and vegetable grow-ers, dairy farmers and poultry raisers who make a ers, carry tarmers and poutry raisers who make daily practice of carrying light loads of produce to market in the tunneau or on the rear deck of ordinary light touring rears. They can leave the borses to work in the field and can make the trip in a third or quarter of the time formerly consumed thereby gaining just that much additional time to be devoted to more work or to reading visiting, attendance at concerts,

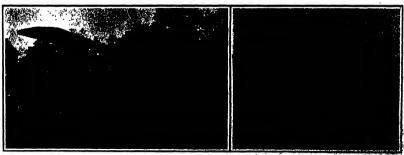

The ordinary four or five-passenger touring ear of modernia power and reasonable price is most extensively used by farmers. Some of the accompanying lituarisations show how such a car is put to practical uses on the farm with the rear seal removed. This is chicago to the general willing automobile of the agricultural sections and is used for a great variety of purposes the section and is used for a great variety of purposes with a rest of wire to repair the fence, runs into town with a rest of wire to repair the fence, runs into town with a rest of wire to repair the fence, runs into town with a rest of wire to repair the fence, runs into town with a rest of wire to repair the force, runs into town with a rest of wire to repair the force, runs into town with the forces of the control of the The ordinary four or five-passenger touring car of addentic power and reasonable price is most exten

mended, carries cans of milk to the creamery or crates of the positry to the express office observing the growing demands by farmers for a care all-around work a wide-awake automobile manufacturing company in Kenonia. Wile, about two years ago began advertising in the farm papers a double-cylinder light touring car at a moderate price, and inside of a year-had as old between 500 and 800 care in the rural districts. There are now probably because the contract of the contract

farmer of to-day is well informed regarding the me-chanical features that adapt an automobile to ble re-quirements and is a careful huyer. He can safely

cannot settine that anothe as attonomes to the re-quirements and a curried hove. He can metaly and can drive ten miles to town in from half to three-quarters of an hour with the load. Largely as a result also of the farmers' demands there has been developed during the lass three or four years a type of motor car called the high-wheeled bugsy. There are upward of fity companies in the country new actively engaged in building this either of motor car especially for use in country either where the reads are rough, hilly, and, according to the season, deep with not, and, or more They are tion, and answer the purposes of many rural dwellers very well. They use only about a gain on gained to fifteen or twenty miles traveled, and a set of nar-row solid tires, counting say 184, will wear a year or more with no expense for repair of punctures or hlow-outs.

Within a year or two there has been added to the two-passenger runabout and four-passenger eurrey models a high-wheel open-bed light delivery wagon model, of the democrat wagon type, especially suited model, of the democrate wagon type, especially mitted to for formers' see. A load of 500 to 500 pounds can be carried in the space beneath and back of the frunt seal, and in soome makes as actric soulce sast can be set in the back to accommodate outra passengers when the back to accommodate outra passengers when which is to be used as a passenger convayance. Other light work wagons with open-back bodies particularly mitted for agricultural uses but litted with bodies. As the control of the contro

manufactured by several companies in Chicago, Syra-cuse, Eigin, Iil., Dewagiac, Mich., and Littis, Pa. They are escellantly suited to carrying to market good sized loads of vegetables, fruit, dairy and barnyard produce weighing from 1,000 to 2,000 pounds, and for aniling back loads of feed, fortilizer, feeding and nilding materials, farm machinery, and so on The

high wheels give the syles and drive mechanism a good road clearance, the construction is of a heavy able as well as simple

Numerous cases might be given of motor cars put to special service in connection with farming. In Maryland there is a high-class dairy farm where motor delivery wagons are used altogether to distribute milk among the consumers in the vicinity, and in Indianapolis a large milk company is using a 14-ton and a 3-ton graciine using a 114-00 and a bion gasoline are true in the collection of milk ritude in the collection of milk returned in the collection of milk vesture. As a single of the city, which is refused to the collection of the city which collection in the collection of the city of the collection of the city of the collection of t These examples seem to foreshadow the time, not very distant, perhaps, when farmers will find it cheaper and more convenient to ship all of their farm products to market on motor trucks than to haul them with horses and wagons. Possibly the trucks will be owned by local express companies organized for the purpose, which will charge a reasonable price for haulage,

coarge a reasonance price for naturage, so that it will pay the farmer better to keep his horses—if he needs any then—at work in the field, and he will not need to invest any capital in the motor trucks Doubtless some of the transporting companies will use motor tractors, which will run over regular routes every tractors, which will run over regular routes over, morning and pick up a string of farm wagons loaded with produce, hauling them to market and back again for a fixed charge. A single tractor should be able

for a fixed charge. A single tractor should be able to haul four or five such wagons over good roads.

In Connecticut a three-ton truck is regularly used for hauling grain and carrying all sorts of farm supplies and products for a 1,300-acm farm. This is one plies and products for a 1,300-acre farm this is one of the many fancy estates conducted in the East by wealthy owners largely as a personal hobby yet at the same time as a profitable investment. The truck represents an outlay of 8,000 and is kept in a special garage for work motor vehicles which are to be

sed extensively on the farm
A ranch of several thousand acres in Montana is conducted entirely without horses, the plowing, sow ing, cultivating, reaping, threshing, and hauling of the grain to the railroad being done by motor tractors and gram to the railroad being one by motof tractors and motor wagons. We have had the horseless street our for twenty years, the 'horseless carriage" for ten, and now we have the horseless farm. May we hope some day for the horseless city?

While the foregoing examples are isolated cases and apply to farming on an extensive scale with ample sapts, they point to great possibilities for the future use of self-propelled vehicles in farm work, utilizing gasoline, kerosene or denatured alcohol as fuel. The gasoline, kerosene or denatured atcohol as fuel. The farmer with a small acreage who would not be just! feel in buying a motor tractor for his own use, will be able to hire his plowing and threshing done by com-panise operating motor tractors, as for many years he has had his threshing done by itinerant steam threshing outfits. And, incidentally, the work will be done chasper, there will be no danger of fire from fring sparks, there will be little or no water to haul, and thore will be fewer men to feed

In this country, as well as in England and France, there are large companies that make a specialty of

AN AVERY FARM TRUCK MAULING SURAP.

building small farm tractors for universal tractive and stationary power work A company in Minneapolis makes an 8 horse-power tractor weighing 5 500 pounds for such work as operating hay presses corn shellers etc and for drawing wagons and portable machines of this class on the road. In York Pa. is another large company that makes motor tractors and tracsarge company that makes motor tractors and trac-tion engines in ten sizes, from 1,000 to 36,000 pounds in weight. The smallest is rated at 1% to 2 horse-power and is intended for all sorts of farm work such as hauting the ston-beat, churning pumping ed cutting, etc. American motor tractors use

d for plowing and American motor tractors used for plowing and threshing usually develop from 12 to 36 horse power and weigh from 6 900 to 20 900 pounds They hauf gang plows turning from two to eight furrows at a time One of these—a 16-horse-power tractor

cents an acre for fuel. In a ten-hour day 7½ acres could be plowed for about \$3.25, not including labor. This wagon tractor is a very interesting vehicle It was designed particularly for farm purposes by mer who are familiar with the peculiar requirements, and nts, and nbines in one machine a truck for carrying loads its own body, a tractor for drawing plows and other farm machinery, and a power

plant for driving threshing machines hay balers and other stationary ma chinery by beit It will take the place of several teams and wagons on the farm

wadays, on the farm as well as in Nowadays, on the farm as well as in the manufactory it is nevessary to do the largest amount of work in the short est time in order to make an under taking successful. This is recognized by the progressive farmer and farm machinery buildors and to a large ex-tant the advantages of the motor car-and, motor tractors are successively. and motor tractor are appreciated by and motor tractor are appreciated by builders of farm wagons and huggies Most of the leaders in these fields are now offering their customers a motor buggy, a motor car, a motor wagon, OF & Motor treator

The Medern Floring Automobile BY REST ORCENTELDY ME, B.S.

The beavy cumbersome electric cab or brougham of carlier days has cleared the field for the light runvictoria or interior driven Less weight means more speed and a greater nilling, radius It was looked upon as a great per formance when one of the earlier types of electric automobiles traveled forty miles on a ringh charge of the

tory mine on a single charge of the battery at a comparative joe speed

The modern electric automobile with modern electric automobile with modern electric automobile with modern electric automobile are the motor and controller, an electric automobile are the motor and controller, two parts which are of different design on about every two parts which are of unitret design in about every, other make. For its various advantages the series-wound motor has outclassed its lival of the sarior days, the compound motor. The series wound motor, if properly designed will do its work for three hun dred and sixty five days in the year without requiring attention The most desirable motor is not that th tends to drive a car up a hill at a comparatively any attention high speed A heavy battery discharge is thus en tailed, which is of course very detrimental to the bat tery Of two cars traveling at the same speed on the level, that one will travel the faster on a grade whose controller was not changed. The motor of this faster

TR OTHERT.Y REPAIRED

car is designed for a smaller increase of torque in proportion to the decrease of the speed. Even if this difference in speed is apace Even if this difference in speed is very small say one-bair final so hour the faster car will have to pay dearly for it in current as well as in develope of nite ago radius and in hattery wear. The good designer will find a middle way. He will strive for the highest bettery officiency it is by no means difficult to construct a

c, as the power is unlimited for a short distance The art is to apply the power at disposal in the most alteround satisfactory way and to design a carriage which is reliable and cheap to maintain

a carriage water is remaine and covery to institute in the line of various controllers the drum type for good reasons seems to have grown into great favor The various speed changes can be obtained without arcing or burning, and a gradual increase of speed is effected from step to step with a small los rouse of (Continued on page 80).

purposes in the field and on the road, was tested at the same trials. Coupled to a two-furrow 14-inch gang

plow, it turned over 106 plow, it turned over 106 plows in 1 hour 25 min-sites on a consumption equivalent to 236 gailons

THE MODERN LOW-PRICED CAR.

BY JOSEPH ROGERS.

The automobile buyer faces no such questions 1910 as confronted him a few years ago, when all that was expected of a car was that it would run. At that time the gasoline engine was not understood as the time the gasoline cupies was not understood as the regineer understands it to-sky and all of the parts and appurienances were undergoing a presens of evolution that resulted in such differences between the models of two successive years. Each make had some poculiar-ity of disign, and the actection of a car was compil-cated by the difficulty of getting definite information

There were reliable cars, of course, but their initial cost and the expense of operation made their ownership possible only to the very well to-do. The car that could be bought by the man of underate income reed close attention and the adjustments and pairs that were a constant necessity left him tittle time for anything cls. If these were in the hands of a repair man the monthly hills were out of all proto the mileage covered and the pleasure ob-Automobiling at that time was unquestionably tained tained. Automobiling at that time was inquestionally a diversion for the rich, and it is popularly supposed that such is still the case, but as a unatter of fact, the man of moderate income can to-day juri hase and use a car at an expense that is well within the bounds of

The primary cause for this is found in the relatively close understanding of engine and car design that ob-tains to-day. The systematic experimental work that hus been carried on in the large factories has resulted has been carried on in the large factories has resulted in a refinement in design and an approach to a stand and that place automobile manufacturing on as eco-nomical a basis as is possible in the production of any other mechanism

any other mechanism

The moderate price at which an antomobile may be bought is not due to the use of poor material and theap labor, on the contrary, the low priced car of today is better in quality than tite highest grade cars

of six years sgo
in the early days of the automobile industry t manufacturer was under the necessity of making sit of the paris, to-day, the factories actually making e 75 per cent of the parts that they use are in small proportion to the number of producers. A few years ago, when a manufacturer purchased his engines, change eed gears or other parts, he concealed the fact, today, a constantly increasing number of firms make it no secret that their cars are assembled in whole or in part. It is in these changes in policy that the ex-cellence of the medium priced automobile is largely

The manufacturer of a complete car is under the sity of maintaining an experimental departs in which he can try out augmented improvements on all parts of the chassis. This is expensive work, and a proportion of the cost of the department must be ina proportion of the cost of the despartment must be incided in the price of every car sold. The maker of an assembled car is under no such handlesp, for each of the firms with which he does builness will carry on only such experimental work as is required for its apoctal time, and the expusse is borne hy so great an output that the individual proportion is negligible. There was a time when an assembled car was undembtedly open to suspicion, for however destrous the

makers of its parts might be to do good work they had neither the knowledge nor the facilities that would nake it possible. These same companies now possess enormous plants, their designers and equipment are the best obtainable, and their products ambody the latest and bost in practice material and workmanship. Assemblers thus have parts at their command that are of a high degree of excellence, and can huy them prices that are far below what was charged for the

prices that are far below what was charged for the weak and faulty product of former years. The low prices at witch assembled cars can profit-alty be sold have forced the builders of cars of com-peting grades to manufacture on a very large scale, in order to bring down costs through economies pos-sible only with quantity production Such a firm equips its factory with light and special tools for every operation, and makes it an inviolable rule to accept no order that calls for even a slight deviation from the standard specifications.

When a manufacturer turns out twenty thousand

A recent development that Illustrates the dodesvor

unfacturing costs is the establishment by me of the leading producers of assembling shops at a large centers. To these are shipped parts in suffi the large centers. To these are shipped parts in suffi clent quantity to build the cars required for that lo cality, and as there is no equipment of machine tool the expense is slight. The freight rate on unasser

the expease is slight. The freight rate on unassembled parts is much lower than on complete cars, and the saving effected in time and convenience as well as in money makes the system a satisfactory or more thousand the saving of the saving dorers stated revently that his profit on a \$1,000 car is less than \$100, this is not excessive when one considers his cormous investment in material and parts, his realty variabor expense ally vast equipment of machine tools, and his

labor expense
It has been said that any average engineer can design a ear to seil at \$4.000, but that the greatest skill is necessary when the soiling price is to be less than \$1.000. However that may be, the medium and jown priced cars on the market show exceedingly low designing and bear every indication of the highest grade of mechanical engineering. Being light in weight, the underlat antering into their construction. is selected with the greatest care, and it is typical of the automobile industry that many of the alloy at In common use were hardly more than isboratory curi

The whole tendency of design is to reduce weight and machinery and assembling costs, but it is rare to see a case where strength and durability have been see a case where strength and durability have be ascrilled for economy. One of the features of the 1910 cars is the casting of the four cylinders in one piece, which results in a considerable saving in weight and cost, with no apparent reduction in strength or billity. The increasing tendency to adopt the gravity system of water circulation is another economical move, for it permits the suppression of the nump Tho nuclearital tubristors that were formerly in general use have been abandened in favor of a single nump located in the crank case which is not only less exlocated in the crank case which is not only less ex-pealer to built and assemble, but makes inherication as positive and unfailing on it well can be. The mag-net is now the slandard equipment even for care of very tow price, and quito frequently it is the sole emeans of ignition. An advantage that may be gained through its use in that the spark may be maintained at a fixed point, and therefore he spark control lover and a fixed point, and therefore he spark control lover and its connections may be done away with The tocaling of the ciutch and brake pedais on the gear case reduces the cost of assembling, for when they are hung on a rod passing across the frame as was the practice on a rod passing arose the frame as was the practice in former years, accurate ditting is an absolute and costly necessity. When the engine, shange speed ger-and rear rate are soparate units, assembling is com-plicated by the necessity for setting them accurately in line, in a great number of 1910 cars the change speed gear is either built in with the ongine or the rear acts, and the cost of assembling is reduced in conse-cution.

axis, and the cost of assembling is reduced in consequence
In spile of the excellence of the 1910 cars, it must
not be assumed that the limit of perfection has been
reached Some of the work turned out by the dealguers shown that they have followed a common path,
but in the consequence of the consequence of the consequence
and the spile consequence of the consequence of the consequence
and the spile check of the consequence of the conserved. The great variance in the designs of to-day
is avidence in these that there is still much to learn,
for otherwise, as an example, there would be less
difference in the dismander of the consequence
of the consequence of the consequence of the
same power. The relation of bore to stroke is the
subject of a vast difference of cysics in the present
time, and even the relative length of the connecting
red is yn onessand. rod is by no means fixed

Having produced cars that will run, and that can be depended on for steady service, the problems now before the designor have to do with the increase of af-

before the designor have to do with the increase of a cleary and excoming of operation. At the presen-tions it is doubtful if any manufacture; heaves what appointion of the power of his engine is absorbed in operating the valves, or in driving the magnetic and runs), but there and other for more complicated de-iry of the control of the control of the control of its the principles of the greenst engine are adhered in the control of the control of the control of the features and retained intensions that survive the orders of usage. For the car conner this will need present control of the control of the features and retained intensions that survive the orders of usage. For the car conner this will need to greater concoming in the use of rus, increased sta-picity in construction, and the relations in price that is the investable result of changed-rispless. In price that is the investable result of changed-rispless.

The Wright Suit and Aviation in America.

The granting last week by Judge Hazel of a preliminary injunction restraining Glann Curties and the Herring-Curtise Company from making, seiting, or flying their well-known type of hiplane has quite taken by surprise almost everyone varsed in patent law, as such surprise almost everyone varsed in patent law, as such an injunction has been granted very rarely, if ever, before upon an unadindented patent. Even in the case of the Belden patent covering the use of a clutch between the motor and the road wheels of an autooccurrent the motor and the road wasses or an auto-mobile—a case in which an infringement was much more apparent—such an injunction was not granted. The granting of the injunction at this time has had two results. In the first place it has intimidated a good many inventors who were hard at work upon the per fecting of the aeroplane, and secondly it has encour feeting of the aeropsane, and secondly it has encour-aged the Wrights to attempt the creation of a monopoly in flying mas hines. With a million-dollar company back of them, and with orders already booked aggregating more than this figure, the granting of the pr ent injunction gives them practical control of aviation In America. A second step in this direction occurred on January 4th, when aviator Paulhan was served on January 4th, when aviator Paulian was served with a notice to appear in the New York District Court ten days later to show cause why he should not be enjoined from flying his Farman hiplanes in the United States. An ea is booked to make flights at the Los Angeles aviation meeting from the 10th to tha 20th, this action may be a serious blow to the first aviation meet held in this country The death of i.e.on Delagrange from a fail sustained

The cash of I-col polagrange from a fail sustained as a result of the breaking of a wing of his Bieriot monoplane while flying in a 20-mile wird at Pau, France, on the 4th inst, has given aviation another schaek that it will take a long time and many excelent demonstrations to overcome Four lives low within the last four months is a record by no means anin the seat our months is a record by no means and coursing to sportsmon, and unless everything possible is done to encourage flight in this country, non-of the ascopiane factories soon to be started will do much business for some time to come

Hydrogen for Infating Pneumatic Tires.

The inflation of an automobile tire with a hand The inflation of an automobile tire with a hand unuit as o inhorinus an operation that some auto-mobilists carry cylinders of compressed air, with which a tire can be inflated easily and rapidly The cylinders, however, may be found empty when they are most needed Drouvity a Freach manufacturer of aluminium paper, has conceived the idea of replacing the air by bridgers managed by the attent of restant aiuminium paper, has conceived the idea of replacing aiuminium paper, has conceived the text by the action of water on appelaily prepared ainminium waste. In presence of aiakile, aiuminium decomposes water into oxygen and hydrogen. The oxygen and hydrogen The oxygen combines with the alum nilum and the hydrogen is after three The method of operation is vory aimple About 10 course of granu tacked aiuminium and 10 sources of water are introduced aiuminium and 10 sources of water are introduced. into an air tube of the capacity (5% pints) which is commonly furnished by the great tire makers, and commonly furnished by the great life makers, and the branes plug is quictly screwed down in a faw seconds the space not otherwise occupied, about 50; pluts, is illed with hydrogen at a pressure of 150 latinosphores This is equivalent to more than 100 galicos of bydrogen at atmospheric pressure The other product of the reaction is situation, which can easily be wanted out. SOME PARTS OF A CAR WHICH MUST BE CAREFULLY CONSIDERED IN OVEREAULING

NOW PARTS WHAR IN AN AVROMOBILS.

AUTOMOBILE FIRE ENGINES.

The great success of automobile fire apparatus in The great success of automobile fire apparatus in Europe and in many of the smaller cities of the United States frequently gives rise to the inquiry, why are such markines and used more extensively in the lerger fire departments where the highest efficiency of apparatus and presented is demanded and main-tained. The acknowledged untilly of automobiles for pleasure and business away under extraordinary con particularly as the modern motor vehicle le now canable not only of attaining high speed but of carrying heavy loads. Promptness in reaching a fire with suitapparatus is of prime importar able apparatus is of prime importance, and the auto-mobile in this respect and in endurance is easily appertor to a horse. To-day with high speeds pumping capacity can be secured in a motor vehicle sufficient for most conditions of service, and this, with seconomy ance after the initial cost, has be adoption of automobile fire apparatus by many of the progressive smaller cities. This economy is obviously due to the fact that only when in operation are gaseline and oil required. A horse even when idle entails expense for shoeing and feeding

Even the most conservative of metropoli tan fire officials realise that the rapid transcan nee one can be realise that the rapid trans-portation by horses and the subsequent op-eration at high pressure of a heavy steam pumping engine on wheels is more or less a nechankal anachronism in these days, when contral power stations have largely taken the place of the small isolated plant, and when small internal combustion motors using gasoline have been found economical convenient, and efficient. The pumping power of a five engine depends upon the weight that can be transported. As an internal-combustion motor connected with a pump would weigh much less than a steam engine and bolier and going to a fire would use the same angine for propulsion, it would follow that greater efficiency could be se-

cured Even auperior from the mechanical standpoint, but not as yet practically applied, would be the mount ing of an electric pump on a gasoline-driven motor car, using current derived from supply mains near scene of operation Chief Sinne of the New York Fire Department has developed such an idea which pos-sosses many obvious merits. He proposes to use elecseasce many obvious nicrits Ha proposes to use circuity-driven centrifugal pumps on motor vehicles capable of high speed and to obtain power from electric light elandards or other outlets which are at most every street corner and quite as well distributed ar hydrants. The same condition also prevails in many rural districts, where electric light and trolley lines are to be found on every main etreet. Suitable | lugs and conductors could be used for connections, and with the power derived from a central station the ble machinery would be reduced to a mini weight A similar idea, though not so elaborately de-veloped, was jut into operation more than twenty years ago by Dr S S Wheeler, now president of the

ratus consisted of a bipolar motor directly coupled to a pump, and was mounted on a light carriage. The gasoline motor car was not so highly developed at this time, for which reason the carriage was drawn by horses. A fire engine built on this plan was tried out on the Eric Canal at Behenctady it was finally brought to Ampere, and was destroyed in a fire which occurred there in 1895 Strange to say, this scheme, which would involve comparatively little outlay for a large city, has never been thoroughly and practically

At present, motor apparatus is most widely used in esturbs and small cities with wooden desilings, in other words, in communities where its high speed renders it possible to cover a much greater target by a single company, and where infrequent alarms reduce the expense of maintenance for below that ex-tailed for feeding and showing horses. For example, a St. Louis motor company recently made a run of nins miles to a country villa outside the city limits and ar-

MOTOR-DRIVER CHEMICAL REGISTS.

rived in time to save the honse This same company in a period of eighteen months responded to 1,000 free without a single failure, and in so doing traveled 2,250 miles in all conditions of weather, including mud, elect and anow. The economy of this company is apparent from the fact that its maintenance account for twelve months was \$481.31, including two accifor twetve months was \$483 31, including two acti-dents, which resulted in an expense of \$250, as com-pared with an annual cost of \$816, for feeding and showing two horses. Even in a district where there are no water supply hydrants, such a machine can make a speedy run, and draw water from a well canal,

in a large city the question of territory is not as important as that of speed in getting the firemen to the fire in a district with high pressure fire protection fires occur which taken in time may not require the powerful etreams from the fire bydrants and could be put out with a minimum of water damage. Indeed it seems likely that the future fire protection of a large city will consist simply of an efficient high-pressure water system and automobile engines and ose wagons.
In a description of modern automobile fire app

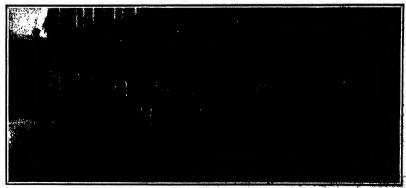

JANDANA THE TOTAL

we may mention, first, the high-speed touring ear or runabout, for the use of chiefs and supervising off-cials, capable of rapid travel and of covering wide spetions of territory This was the first automobile use by fire departments. Buch a car does not usually-easy inguishers or any fire apparatus, one or extinguishers and assess their tools are a superson, we to be a superson of their tools are a superson of the extinguishers and axes or other tools be

that supplied to the battation obigs, or the head of the fire department of the smaller city Extingulahers and tools are of the con-sidered essential. The chief carries with him not only a chaufeur but one or two firenim not only a reagger but one or two errors men from the permanent headquarties force. If rapid travel is desirable for the chief, it is of course equally advantageous for the fremen reagending to an alarm. In small blazes such as those caused by a curtain blazes such as those caused by a curtain blazes such as those caused by a curtain blowing against an open gas light or, by a short-circuit of a lighting system, one or two men with axes and hooks promptly on the scene can prevent what might be a furtious scene can prevent what might be a 'agripus fire in a dwelling house or stable. Aspord-ingly it was early realised that auxiliary or emergency squads could be equipped with motor cars and could be dispatched at high speed to the scens of the fire. These men deal with an incipient fire or prepare for the

deal with an incipient are of prepare nor used is seem engines which follow and if necessary seed is additional alarms or communicate by telephone with beadquarters. This type of equipment is extensively used throughout the United States.

But it must be realized that this means simply the prompt bringing to the scens of action the trained men who can take care of the smallest kind of a fire done where the blaze is at all serious. It was with this end in view that automobile fire-fighting facilities were increased by adding a chemical tank and a few ware increased by adding a chemical tank and a five hundred feet of email hose The chemical tank and equipment has now become an indepensable feature or many five departments. Carried on bore-drawn hose wagon, a small fire can be quesched in it al-cipleacy by its means with a minimum use of water and consequent damage. The chemical tank consists of a copper citerion of from 40 to 10 galious capacity containing bleatworstee of sods and other chemicals with which equipment can be designed to the con-with which equipment can be designed to the con-with which equipment can be designed to the con-tent of the contract of the contract of the con-tent of the contract of the contract of the con-tent of the contract of the contract of the con-tent of the contract of the contract of the con-tent of the con-tent of the contract of the con-tent of the con-t

the wagon being reserved for larger fire-sagtise hose. Inti in a property designed automobile such apparatus can be sped to the some of a fire with four to additionen at from 60 to 50 miles an hour. Thus for a fire in a small substrated aveiling, in the majority or cases, as the contract of the contra

that such chemical engines be supplied in the ma-jority of fire departments to answer at once on the first alarm

first alarm

The next step in the progress of the small motor chemical engine was to make it larger and to add to tile squipment. Accordingly combination engines were designed which not only carried the chemical equipment but also bose for the following steam engine, scaling indders, tools and other apparatus, thus en scaling isaders, tools and other apparatus, thus en abling the men to prepare the way for more serious operations and saving valuable time. In this field a number of very efficient types have been evolved. Next in mechanical development comes the motor (Continued on page 69)

A HEAVY TRUCK WITH FOUR WHERL DRIVE

The adoption of trucks in rural districts is a diffi tuit though very important problem of the automobile industry Bad roads and sandy soil create a number

the corrugated segments are dispensed with, and a replaced by a smooth strip of hard bream. This pike nel has no connection with the spring wheel propert. The general design of this inner section issay of comprehensively garbered from a reference to the With a single trailer gradients of 7 to 8 per cent can be negotiated at a speed of 5% miles so that the our seems well suited for making its way with the trailers also through deep sand

TRACTOR TRUCK (60-HORSE POWER 6-CYLIFDER) RAULING A TRAILER

THE SO-HORSE-POWER MOTOR OF THE POUR-WHERE DRIVE WEREN

of difficulties which can be overcome only by special construction

One of the most important points seems to be the utilization of all four wheels for driving thus increasutilization of all four wheels for driving thus increas-ing the adhesion. This is especially imperative in the case of heavy motor cars employed as tractors for load traits consisting of two or three vehicles where a weight of several tons acting on the fore axic can be utilized for adhesion. The Delimier Motor Works of Germany have con

structed for a well known Berlin export firm a heavy truck with four wheel drive which is being shipped to South Africa in order there to take up its heavy duties in propelling as tractor a train of 10 to 15 tons. This car shows a number of technical features

The chassis is made of compressed sheet steel gir The chassis is made of compressed sheet stees graders with compressed transverse beams and interestableds. The six cylinder applosion motor located in a three point suspension picks 60 horse power at the brake with 90 R P M. This motor is of the familiar. Daimler type with magneto-electric ignition

The maximum speed of the car is 10 miles per hour The low minimum speed 1/4 mile an hour is remark able thus fully utilizing the advantage of four wheel drive for the overcoming of gradients and traveling over sandy soil without increasing the dimensions of the gear case As only the for, wheels are sterable the rear wheels are driven through a toothid wheel

The rast steet wheels have broad rim flanges which are briended to prevent the vehicle from penetrating too deeply into the sand. The solid rubber tires are pressed immediately on the wheels. The fore wheels pressed immediately on the wheels. The fore wheels are steered essentially in the same manner as other care through wran gearing. The vehicle is equipped with four brakes operated independently of one an other via a graring brake two differential brakes and one rear wheel lrake. The motor car which is design ed for a useful load of f tons is able to haul two trailers of the same capacity while negotiating grad-ients of about 15 per cent with this total load of 130 hundredweight at a speed of 1½ miles an hour is about 12 540 pounds of which about one-half falls on the fore axis so that about 6.270 pounds on the fore axis is utilized for adhesion

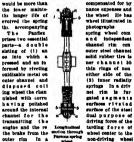

THE PARSONS SPRING MOTOR WHERL

The many well known defects of the pneumatic surface mobile tire have prompted many invenders to attampt to evoive an efficient and reliable substitute therefor without any arentice of resiliency. The general trend of inventive effort has been to secure this quality by some slaborate arrangement of springs without how over completely solving the problem Early in 180° however the Hon R Cleve Parsons M A M Inat! F directed his attention to this substitute of the state of The many well known defects of the pneumatic auto

what higher than the pneumatic such a difference would be more than compensated for by

view of the ingenuity of its construction the ever existing danger of side slipping is reduced to a neg lightle quantity owing to the firstbility of the wheel

AF AUTOMOBILE CAR POR BAILWAYS

The accompanying illustration shows a special car ordered by N II Harriman before his death which is to be used on a private road running from a point on the Eric Railroad to the Harriman private residence

The car is a Lambert friction drive and was ordered e of ascertaining whether a gasoline ca for from 12 to 16 passengers could be utilized more economically than steam cars on branch roads on the Harriman lines Whether a car of this character will come into general use will depend upon the result of

AN AUTOMOBILE BUTTET TEMPER

A novel automobile tender has been devised G L Reeves Mounted in the body across th end is a three-burner gasoline stove connected with a one mallon masoline tank Next forward is a receptacle one gainer gasoline tank. Next forward is a receptacle in which is fitted a complete cooking outst seach article sesting and telescoping into the other. The outsit consists of two frying pans four boiling venuels of fee pot twenty serving plates three savre pans and eight soup time. To the left of the cooking outsit is a three-bin vegetable celler with tray lid for large cook in the contract of the cooking outsit is a three-bin vegetable celler with tray lid for large cook. ing spoons cake invoices carving forks etc. To the right is a galvanised iron lined refrigerator containing six emergint class sealors ice recentacle and large me

Immediately forward of the refrigerator and extendimmediately forward of the refrigerator and extending to the end of the bed is a seven gailo water cooler. To the left of the water cooler is a thirteen drawer cabbut intended for all grossery and cooking staples halves forks spoons ten towels, table covers, etc. In the little open court there is just room for two tolescoping dish pans to disappear. The accompanying picture aboving the kitchen open tablessets that the two covering life when opened out from two expectors severing tables. These tide are correctly only the contract of the

ered on the inside with padded ollolob, and on the outside with rainproof ducking. The meeting edge of once cover is provided with a parent leather flap and is held in place in inransit by two large strape which beared as the strape of the bardle security and make the trader rain and dust proof. A small brass hasp and lot is also furnished A meat little folling duling table is strapped to the in aide of one of these lids

An extra broiler a cooker for emergency a pocket ax and a camp lantern strapped to an outside bracker aplete the outfit

The refrigerator and water cooler are fitted with drain cocks. A rigid pair of folding legs is provided to support the end of the body when disconnected from the ente

The wheels have rubb are so accurately nested that the tender moves even at twenty to iwenty five nilles speed without noise and

at twenty to wenty no mints speed without some and takes corners perfectly. The tender weighs 476 pounds and the extra draft on the antomobile is searcely perceptible. It has been need in serving a great many roadald, dimors and its entire practicability for such service established be-

A VAN DANAMOMETER

The standard type of fan dynamometer chown in the accompanying photograph has been devised by Joseph Tracy It consists essentially of a metal standard carrying a bortrontal steed shaft in large ball bearings. One end of this shaft is connected with the otor under test by a universally jointed exten motor under test by a universally jointed extension shaft the other end carries an overhung two bladed fan as shown. On the dynamometer shaft a small pulley fitted to a bose on the rear of the universal joint is belied to a larger pulley on the special tacho meter which is mounted on top of the housing that

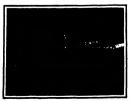

meter wate is monner on top of the noming ma-carries the dynamometr shaft.

The tachometer of the standard fan dynamometer is provided with a double scale and single pointer the inner scale showing the revolutions per minute and the outer scale the horse power diviloped. The neve lutions per minute scale is braduated progressively by divisions of 20 revolutions from 200 to 4000 r volu divisions of 20 revolutions from 200 to 2000 r volu-tions. The horse-power saie gives a minimum read-ing of 1 horse-power at 480 revolutions and a maxi-mum reading of 70 horse-power at 1980 revolutions Consequently at all ordinary rates of motor speed. simultaneous reading of revolutions per minute can be obtained without any computation

The standard fan dynamoun ter can be employed in testing motors on the block by making suitable con noction between the jointed jynamouncer shaft and the motor shaft cluth or flywhich if can also be used to test an automobile motor in position on the chassis by disconnecting the propeller shaft and sub-stituting for it the jointed shaft of the dynamometer

The standard dynamometer is designed to test me The standard dynamometer is designed to test mo tors of na dium sized cars. However by the use of fan blades of greater or its area and suitable tacho-moter saties the range of absorption and measure-ment of power can be varied between wide limits

The Tenth National Automobile Bhow in Madison Square Garden afforded a good opportunity of inspect ing the product of representative American makers the exhibition brought out some noveities in con-struction and design which showed a gratifying tend on union and designs which showed a gratifying tead they toward standardization. That the modern overy day motor (ar generally known as a stock (ar has left the misty rone of experiment and is now a practi cal and useful machine was strongly emphasized by the many performances in bilicilmhing touring and racing contests of 190). There is a comprihensive display at the Garden of duplicate models of the stock ousputy at the current of duplitate models of the stock cars that competed successfully in the various sport-ing events of the year. Some of the original cars are shown. Thanks to the adoption of certain standards a new model need no longer be put this only years ut testing before it is entered in competition with other cars Recently victories have been won by certain makes of cars that had scarcely competed in previous

ANTI JOY BIDS DEVICES.

ntinued from page 49)
saft connection with one of the vehiade by flexible shaft conne cla wheels.

5. Combination mechanisms, embracing switch and engine hood lock and vibration recorder

engine hood look and vibration recorder Some of these devices are now to all intents practi-cally obsolute and out of the market, and there never has been any general demand for any of them except those intended merely to prevent meddlesome persons

and mischlevous children from tampering with ma-chines left standing at the curh The one class of device that is in almost universal use is the lock ewitch vice that is in almost universal use is the loca which Almost every large manufacturer of ignition spark coils and ewitches offers a current switch with a removshie plug or lever or fitted with a lock and key by which the connection between the battery or man by which the connection between the battery or mag-nete and the engine earst pings can be broken and prevented from being re-established readily. The type of switches with removable ping is illus-trated in Fig. 1 Switches of this type are known as

trated in Fig. 1 Switches of this type are known as plug cutout ewitches and are now designed to be used with a dual system of ignition, so that either the bat tery or magneto cau be switched into use or the cur rent from either of two batteries turned on When the car is stopped, the metal plug, with insulated han die, which makes connection between the two termi-nals within the switch, as shown in the underside view, Fig 1, is withdrawn and the circuit is broken. Th Fig. 1, is withdrawn and the circuit is broken. The engine cannot then be restarted until the plug has been replaced or electrical connection has been re-established its some other way. The plug is small and cap be carried conveniently in the pocket. A modification of this type which precludes the pos-

A modification of this type which previousle has pos-sibility of inserting a nail or piece of wire as a sub-stitute for the plug is shown to Fig 2, in which the switch lever is removable. There are numerous makes of such switches. The end of the lever engages by a elot or keyway with a post that prevents it from drop-ping off and at the same time assists in forming an electrical connection. The other end of the lever, fitelectrical connection. The other wan of the level, is ted with a non-conducting composition handle, can be swang in an arc or complete circle to make contact with any desired contact button for use of batteries or magneto or to neutral "off" position

magneto or to neutral "off" position
A further development of the lock switch idea is
seen in the auto lock ping (Fig. 3) in which a Yale
clock is applied to a ping cut-out switch in such a way
sa positively to prevent the closing of the circuit
through the switch without the proper key or its dupitcuts. The lock is placed directly above the ping
cocket, thus prevention the insertion of a nail or wire soczet, thus preventing the insertion of a null or wire The cut-out ping is connected with the mechanism of the lock so that it is thrust in or out by the turning of the key. The key cannot be removed from the lock until the circuit is broken. Each lock requires a dif-ferent key, of which two duplicates are furnished to

The Vale lock, with allding plug connection to The Yale lock, with silding plug connection to take the place of the regainsr endout plug, can be fitted to various styles and makes of ewitches, being held on by acrews of a special kind that cannot be removed except with a double-pointed wrench made just to fit the recess in the acrew heads.

the recoss in the screw heads.

A device of somewhat eimilar characteristics to the foregoing is the break-circuit antolock (Fig 4), which is manufactured in different forms for use on electric and gasoline vehicles. The type illustrated is for elecand gasoline venicles. The type intustrated is for exe-tric machines, but the operation of the two styles is similar. When the switch bar, just above the barrel of the Yale tock, is pulled forward it breaks the circuit and remains locked in this position until one of the and remains locked in this position until one of the two kops furnished with the device is inserted and given a half turn, when the connection is re-estab-ished automatically by the ewitch har springing back into place. The electric vehicle lock is installed beneath the upholstering on the arm of the seat, whe only the face of the tock is exposed. It takes the pla of the ordinary cut-out plug, so that the operation of the lock is no additional bother

The break-circuit took for gasoline vehicles (Fig 5) de in dif rent siyles to apply to various sys is made in different sijies to apply to various systems of ignition. It is placed out the face of the cell position, taking the place of the unual switch. The switch-har is round and provided with a winged head, so that is can be rotated to make connection with battery or magneto or to "off" position at will. When it is provided in the magneto to a "off" position at will. When it is part of the research to track the arrow place for ward it breaks the circuit completely. It is not necessary, however, to turn the har or plug to much before tocking or unlocking the switch.

Another means of accomplishing the purpose of pre-whiting mediisonne persons from using a sar left standing in the effects of a grange in the Rochester evering wheel lock (Fig. 6) This is hinged so that the hars on the placed around the steering cold to the steering cold the steering cold to the steering cold the steering cold the steering cold to the steering cold the steering cold the steering cold the steering cold to the steering cold the steering cold the steering cold to the steering cold the steering c

steeling wassi lock (Fig. 6). This is hinged so that the hasp can be placed around the steering column. A steel pin at the back of the hasp enters a quarter-inch hole drilled through the outer and inner steering columna. When the hole in the inner column, to the top of which is hayed the steering hand wheel, has heen brought opposite that is the outer post and the piu of the lock has been inserted through both, the front wheels cannot be turned. The special feature of this device is the combination lock that renders unnecessary the use of a key, which may be mislaid, forgotten or lost. The barrel of the may be misistic, despotate or loat. The harrel of the lock constant stores tumblers one by the lock constant stores tumblers one the provided, with a small lag on either side which engages with the overposting large on the seat tumbler. Two tumblers are handead to an internal top cap but are free to reaste on its center pin, while the third tumbler is removable and lies in the hody or easing of the lock over a solid post that passes through its center All the tumblers have a large notch the the professor. All the tumblers have a large notch the the order is did and until all of the notches in the tumblers are brought into line, althoring the each of the hasp to pass. This can be done only by working the lock combination.

The lock can be operated in the dark, as the did is

can be done only by working the lock combination. The lock can be operated in the dark, as the dial is noticed so that by starting at 0—which is distinguished by a large or open noteh—the movement of the hand over the dial can be counted as the spring points drop successively into the serrations. When the lock is open, the combination can be changed in two minutes of desired Except for the stead plan, this lock is made entirely of hrones and is made in different clears to it feeting discount of different dimeters. The manufacturers have also preduced an adjustable happ steering columns lock made with four-tumber combination and operated by a key

In division B of group 2 is a new invention b out this season under the name Bongartz autol (Fig 8) The device le designed as a lock to prev (Fig 8) The device is designed as a lock to prevent use of the gear shift inver and, if desired, also of the hinkle lever. It consists of a simple lock incased in a reliable heavy brase case to be altached to the side of the car or the footboard directly behind the lever quadrant, and a rod with a head on one end and a recess in the other end to be engaged by the plunger of the lock With the guar-shift lever in neutral or in operative position, a hole of suitable size is drilled through the quadrant and shank of the lever to receive through the quadrant and shank of the lever to receive the rod. The lock case is then secured to the body or frame in such position that the hole for the end of the rod will be in alignment with the hole drilled through the quadrant. Now, when the car is stopped and the gears unmeshed, the rod can be inserted and ougaged in the lock, when it will be impossible for anyone not ing the key to start the machine

possessing the Rey to start the machina.

A notable advantage possessed by this device is that,
white preventing the car from being driven on the
road, it does not interfere in any way with its movement by hand in the garage or with the adjusting and
"tuning up" of the engine and its attachments by the chauffeur or workmen

chauffeur or workmen.
Not only is it essential that the unauthorized use of motor cars should be prevented but it is almost occupity desirable that some measure be taken to curb he speed enthusiasm of the hired chauffeur even when the owner is occupiting the tomosa or interior to the immossine or landaulet it is not altopather improbable that the owner needs a check on himself, as in the cellitarition of a good read, breeing atmosphere, and smoothly running car he may unwittingly let outhu-siasm overstep discretion. Numerous efforts have been made to produce something that would accomplish made to produce something that would accomplish such results by the sounding of audible signals when the car had attained to a certain speed or by the dis-play of a prominent speed indicating device that could be read at a distance by every passer-by. The objections to these devices, however, were so obvious that they never met with favor except on the part of persons never met with motorphobia and hwmakers eager for popularity among their constituents.

A practical device intended to accomplish the same

te in a much better and more effective way has been brought out recently for use in combination with n well known make of apsedometer This is the Jones automatic speed-control governor (Fig 9) The mechn well known make of apsedement. This is the Jones automatic speed-contrel governor (Fig. 9). The mechanism consists essentially of a speed indicator, an automatic cleral breaker, a controller switch, and automatic cleral breaker, a controller switch, and caterier switch, which has fire or more points of contact representing circuits, to persuited by the sciling of the contringal governor of the speed indicator. These writch is so arranged that when the indication. These writch is so arranged that when the indicator. These writch will cook the circuit through the first contacts of the switch will cook the circuit through the first contacts of the switch will contact aftern mine an hour on the dail, the switch closes a circuit through the second contact, and so FF setting the positer at any furure on the dail of the controller switch, the circuit cate through the corresponding contact only and at the indicated speed When this circuit is closed, it actuates the curvate to the printary of the indicator or spark coil, thereby critician of the spark from the stageto. Or it may be arranged to coperate the disc

or spark coil, thereby critifiag off the spark from the supine Or it may be arranged to operate the elec-trically controlled air valve or throttle, shattling off the supply of air or gas to the sciption and thereby pre-vanting the speed of the our from exceeding the in-dicated limit. As soon as the speed is regioned, the contact automatically critis det and the suggle sets its power again. Bloudle the spotter of the operatedling

switch he set at in intermediate position, as in illustration, the device will have no action whate on the speed of the car.

on the speed of the 68s.

As the controlling switch can be located abuser surwhere in the car, it is evident that the owner or any
compant of the rear heat can limit the speed as
desired, regardless of the driver. The device operates rity and is always on guard, giving a sense rity in passing through sections where the sp

security in passing through sections waste the speed regulations are rigidly enforced.

An example of the vehicle movement indicating is attument classified under A, group 4, is the watch-dog vibration register (Fig. 10); This operates on the principle of the pedometer, 4 pendicum or weighted arm being held normally in a horizontal position by light spring and caused to beat by reason of the comentum of the weight following every downward momentum of the weight following every downward and puward movement of the instrument. Beach-front of the pendulum releases a tooth in the train of gears which actuate the indicator hand and register figures on the dist. The dain is 3½ inches in diameter and is divided into 10 degrees. These divisions do not represent either hours or miles, but severe as a measure of the vibrations. Different cans occiliate vertentially in different periods, it has been found, but each machine occillates very nearly the same number of times for occlinates very nearly the same number of times for successive miles irrespective of its speed. Engine whrs-tions when the car is standing still do not affect the instrument, therefore the device makes no record ex-cept when the vehicle is in motion.

The instrument is intended to be attached perma-

The instrument is intended to be attached perma-nectly to the car so that it cannot be removed without the owner's knowledge and is securely sealed so that no one can tamper with the register. There is no shaft or wires connecting it with any working part of the automobile whose detachment or disconnection would render the recorder luoperative. The owner, would render the recorder inoperative. The ownship of potential of the instrument indicates say 10 points for each how to travel, will have no difficulty in determining from the reading of the dial how many hours his machine has been driven after he last had it out.

A different type of whelche movement indicator is

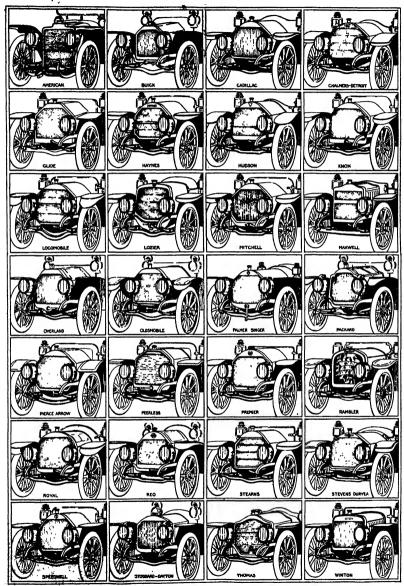

A different type of vehicle movement indicator is represented by the Bullard recorder (Fig. 7). This provides a permanent record on paper of the hours during which the vehicle was used, the rate at which it was run during overy mile traveled and the number It was run during every mise traveled and the number and duration of stops made. It operates by a combination of clockwork movement and fexible shaft drive from one of the road wheels. The clock mechanism rotates a circular paper dial that makes one complet revolution every hour in the same direction as the hands of a clock. The dial is divided into sixty radial spaces representing minutes, every fifth line being heavier than the intermediate lines for convenience in heavier than the intermediate lines for convenience in reading From center to circumference there are twelve circular divisions, also corresponding to the hours. Within the instrument is a stylus operated by both the clock and movement of the car, which makes a perforation in the paper dist for each quarter mile traveled, every fourth perforation being deeper than the others to indicate the completed mile The stylus is at the extreme outside space when the instrument is set for a record and moves toward the center at the rate of one space each hour, being moved by the clock and requiring twelve hours to more across the dial, where it becomes inoperative until reset. So long as the oar stands idle the dial rotates with-

so long as the our stands lide the dial rotates with-out being punctured by the stytes, but for every quar-ter mile the car travels if a piesaure vehicle) one perforation is made. And according as the machine is driven fast or slow the holes are close together or farther part. At the rate of a mile in four minutes, or farther part. At the rate of a mile in four minutes, or fitness miles an hour, there will be just one hole for each radial division, while at sixty miles an hour there would be four By examination of the dial it is po-ssible to determine the exact hour and minute at which he car was started and stopped. Combined with the instrument is a tiny ofcensive which registers the total milesga up to 10,000. The instrument depends for operation on a simple train of gears and ordinary clockwork and the same connection with the red wheels as every speed indicator. The investor decided upon the perforesting system because it cannot be tampered with without detection, no jar or joit of the or can decease; it and cold weather or dry counter. tampered with without detection, no jar or joil or use car can desumpe it and cold weather or dry cannot render it inoperative. For use on commercial vehicles, which move at a slower rate of speed, the stylus is made to perforate for every gighth mile instead of

wanted to perform for every gapua-every quarter.

MAKING YOUR OWN REPAIRS.

BY ROGER B. WHITMAN.

ho is familiar with the methods employed in the average automobile repair shop it is not sur prising that where of cars contiain of the size of the trincipal charge is usually for lab at so mu h an hour but there is no way in which at so much an hour but there is no way in white the own r can assure himself that pair of the time charged for was not wasted. The difficulty of check ing a labor charge is an inducement to a mild form of swindling and it must be admitted that there are shops in which an hours work by an untrained boy is charged for at the rate for skilled labor. Inco as the may be wated uniformly in 1 like again line may be wated uniformloadly I is not unusual to find that after assembling an engine of a gearst the work must be undone in order to fit an overlooked part or to correct on adjustment that about how been attended to in the first place and in such an event the total time occupied is usually charged to the owner of the car

chargest to the owner of the car When the prespective purchaser of an automobile, is of a properly inquiring turn of mind be will ask his friends to let him see their bills for repairs and maintenance and will probably gain the impression their entomobiling is an expansive diversion if he has any mechanical ability however he will realize that three-quarters of the work charged for could have been done with simple tools and an ordinary knowledge of

Aside from the economy of it the owner who does his own work becomes so familiar with the mechanism that it is instinctive with him to recognize the signe of coming trouble lie corrects faults at their in ception and by so doing be obviates an otherwise

inevitable delay and expense

The following notes are offered as suggestions to
the owner who desires to render himself independent

VALLE GRINDING

At more or less frequent intervals the valves of a soline engine and particularly the exhaust valves gasoline engine and partitularly the exhaut valves will become roughness and pilitude. When they are in this condition they cannot be expected to retain the compressed sease and to consequence the engine can not deliver its full power. It then becomes necessary and the valves which has a complished by in toducing an abrasive between the valve and its seat and rolating the valves which their pressure until the surfaces are were amonth. This is usually considered to be a feet for a repair man thus as it is patients rather than skill that is required the car owner need not healtast to undertake it.

rather than skill that is required the car owner need not hesitate to undertake it. Before grinding can begin the valve must be ru-lered from the pressure of its spring in many ex-gines in valve, seat and spring are contacted in a case that is ceally removed and the detacted of the apring from the stem is an easy matter. When the valve seat is integral.

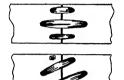

with the cylinder the spring hay be compressed by means of a special tool or by a flat metal bar used as e lev r 10 prevent the valve front mov-ing a small block of wood may be placed between the valve disk and the valve cap When the spring is com-pressed the device through which it acts on the valve strm may be removed the valve may then be taken out through the valve cap open

When a valve is in bad condition the surfaces of the disk and seat are rough and pitted. It is not necessary to continue the grinding process until the entire width of the surfaces is smooth for a harrower ting of bilt is sufficient to retain the paves if it is emiliacous and unin

terrupted Fintly powdered entry mixed with ma chine oil is a satisfact; abtasive but whatever is came on its a santaer(s) submisse our waterer is used great care must be taken to keep it out of the cylinder and away from the bearing surfaces. The passage between the valve packet and nylinder about it lightly plugged with colon pasts a string tied to ir () illitating its removal when the work is completed her a hadiy worn valve the first grinding is dos with course emery which is later replaced by a fine

LINING UP THE WE

grade to give the requisite smoothness. To apply the abrasive dip the finger tip in machine oil and then it day energy the small quantity that address being applied to the vairs surface. The vaive is then re-placed on its aext and rotated by means of a serse driver. A bit brace or breast drift may be used but consider the control of the control of the control of the conexcellent results may be obtained by means of an 8 inch or 12 inch a rewdriver with a round grooved bandle which is held between the extended palms. A con

tinuous rotary motion in one direction will tend to wear the valve oval and it is necessary to turn it first in one direction and then equally in the other A slight back and forth motion of the hands will give this result and as only a light pressure is neces

it should not prove tiresome In order to preserve the true circular form of the In order to preserve the true strustar form of the valve and scat the valve should be lifted after twenty or thirty turns and replaced on its seat in a new po-sition. To facilitate this a refe turns of a belical spining may be placed in the valve pucket under the dark its size and strength being such that the valve will be alightly litted from its seat when pressure is classed of the actual view of the location of the spring takes of the actual view of the location of the spring

is shown in the diagram. When the valve surfaces appear smooth all traces of the emery should be washed away with gasoline can bring takes that it does not todge in the visited vaire stem and push rod galdes or other bearing parts. To lest the fit make peerl marks on the valve sees and give the vairt a turn or two with the emerginative if the fit is correct the marks will be exceedingly in the present of the second of the correct of the correct of the second of the correct of the cor is shown in the diagram

valve seal and give the valve a turn or two want the arreadviver if the fit is correct the marks will be erased

The replacing of the valve epring is greatly sim plified if it is compressed in a vise and bound in the compressed state by light iron or copper where passed through it lengthwaye. The apring may then be

to notice the exact position of a piece before he takes it off and in general is unobservant of the foresight that would go far to simplify the reassembling. If time is not an object, he will eventually get all the parts properly rebuilt but if he sapires to be a good an he must learn to be methodical in every

that he does
The first step in dismounting any part of an automobile is to ascertain what holds it in position what
other parts may have to be displaced in order to get
at it and what parts may be released by its removal To take off an inlet manifold for instance it nay first be necessary to remove the carburster which in turn will require the disconnection of the gasoline

to turn will require the disconnection of the gasoline byte and throttle control.

The plan of action having been determined work may begin it will greatly facilitate reassembling if nuts boils screws and other small parts are placed in boxes the parts belonging to the third type in one, inspection plate boils in another and no on. If these larts are laid influentimitatily on the engine and rare are laid influentimitatily on the engine and control or the second of the secon

moved so that there may be no error in returning them moved so that there may be no error in returning thems shem manufut curres are careful to mark all parts by listice or figure or with a prick puzzh and when this is the case the marks should be followed absolutely in the case of genera it is usual to make three puzzh marks at the point of meshing. To reassemble them correctly it is then necessary only to place the marked tools, of one gave the west the two marked techs of cold, of one gave between its two marked techs of

When taking off a cylinder the connecting rod should be blocked or supported Otherwise the weight of the piston will bring it sharply against the crank case which may suffer in consequence if the cylinders are to remain off for any length of time they should be plugged with cotton waste at all open ings and several thicknesses of paper should be tied

tings also be placed to the control of the control

avoided natil it is proven to be necessary Taper plus knys and unampeted set acress are frequently re sponsible and as they must be accurately replaced their location and direction should be noted and remembered it is poor policy to rush a plote of work and after a few experiences with com-pression water and gasetine leaks that could be avoided.

beaks that could be avoided by giving more time to the job in hand the metorist will hang in his shop the motto Go slow, go sure," and abide by it

AUTOMOBILE NOTES

AUTOPAOBILE NOTES.

Undoubtedly the weak points in the pneumatic tire whather it be that of a cycle or motor vehicle, are its cost of up-keep and ilability to puncture. It is clear that the direction in which improvements have been made is in the thickening of the tread, so as not only to render punctures less frequent, but also to give the tire a longer life, and thus save expense in some makes of tire, the increase in thickness of the tread makes of tire, the therease in thickness of the stread of the outer cover, and in others that of the inner tube, has been so great thet most of the resiliency has been lost, and the tire practically becomes a solid one. In order to restore the resiliency, it has been proposed to reduce the air pressure in the internal tube, but this the inner tube and the cover, which is in any case dif ficult to avoid altogether, but also produc fiat surface. In contact with the road, which adds considerably to the tractive resistance, especially when the surface of the road is soft. The sylle of traveling i stack pneumatic tires are known to all cycle rider of are carefully evolded by keeping them inflate with n sufficient air pressure. The air pressure which it is necessary to maintain in the inner tubes of the pneumatic tires of a heavy vehicle is not less than 10q pounds per square luch, and should the slightest defect occur which allows the air to escape, the tire is not only rendered useless to support the vehicle but is speedily damaged if the collapse is not quickly repaired

At the Tenth National Automobile Show in Madled At the Teath National Automobile Blow in Madlson Square Garden there will be the only complete motor cycle exhibit in New York in 1910 by the Motorcycle Manufacturers' Association An inspection of the new models on display there proves that the motorcycle not only is a pieasure vehicle for poor and rich alike ranging in price from \$100 for the small single-cylind machine to more than \$500 for the expensive four touring model de leze-but a utility vehicle General refinement seems to be the tendency as well General refinement seems to be the tendency for 1910 Many improvements have been made in spring forks as the result of hard road contests during the past year 50me of the machines appear with spring frames and longer wheel base, all of which make for the comfort of the rider As regards the appearance of the motorcycle better quality and more isating enamel as well as heavier plating seems to be the aim of the manufacturers. Handlebar control is practically universal, and magneto ignition will be more practically universal, and magnete (galiton will be more popular than ever, several of the makers kaving decided to make this type of Ignition standard equipment, instead of optional as heretoforn linerased power apparently is a genoral tendency, and mechan lead olions are also in evidence, which climitate guesswork in tubrication, one of the bugbears of riding several of the manufacturers have decided to abolish the muffer report which, with the muffer improvement noticeable, should make the motorcycle of 100 as allout a size of as its forcument, the bicycle.

The Chalcace Detection have models will be manu-

Two Ofbianer-Detroit chassis models will be mann factured in 1910, the "Thirty" and the "Forty," both a continuation of those presented for 1909 The clanges, while important, are not in any case radional The new Chaimors-Detroit "Thirty" will have a 115inch wheel hase, three inches ionger than the 1909 Forty It will have 34-inch wheels—two inches

The Teath National Antomobile Show in Madison Square Garden eclipses any former exhibition of motor cars, motorcycies, and accessories over held in the famous building There is a total of \$23 different the famous building There is a total of 333 different display, or which there are 3 exhibits of complete care besides 240 exhibits of accessories and parts, and 71 monterprice oxibits is free with an increase over last year of more than 7000 fews with an increase over last year of more than 7000 fews with an increase over last year of more than 7000 fews with a successive which the show managers by impestious methods were able to eke out of the Garden interfor, there is not one foot of unared space a validate for oxibilities purposes. This actuation is indeed a striking commentation of the striking of the striking of the striking commentation. at the first entomobile show in this country, in 1900, there were only 60 exhibitors who displayed their product in the Garden

Noteworthy among the runabouts costing much less than \$1,000 is the liupmobile made by the Hupp Motor Car t'oupany Detroit Mich in its construcskors have endeavored to impart to the runabout all the staum bness excellent workmanship, and trustworthiness of the seven passenger touring car The four-cylinder engine is of 20 horse-power, car The rout-tylinder engine is of 21 norse-power, with four cylinders having a stroke of 3% inches and a bore of 3½ inches. Water cooling is employed. The transmission is of the selective alking goar type. The multiple disk clutch runs in oil. The regar axis is shaft driven. There are two foot brakes and two emergency brakes. A Boach high-tension magneto is

provided. Romething new in the Garden show is to be found in nearly avery one of the models exhibited. Some of the new point of interest are found in a nice and the new point of interest are found in a nice at transmissions, and in lubricating greens. In bodies, as type that seems to be gaining favor is the one passenger surrey, which is but a tonneau without doorn, built low in the back and idea, yet provide plently of seating space. The care at the Garden show range from the condition of the market down to that the runshout that is cheap enough for anyone.

tle runshout that is cheap enough for anyone.

Ja 1901, Mr Byron J Carter, then of Jackson,
Mich, realising the shortcomings of geared trans-missions as used in automobiles, began experiments
for improvements, being naturally attracted to the riction system because of its manifest advantages.

After months of careful research, the first Carterur After months of careful research, the first Carcerus ricidend-driven automobile appeared in the anumer of 1903. This automobile was of the runshout type, and in addition to the radical improvement in transmission parts, was well designed and constructed. The car has run more than \$5,000 mites, and is now, with out repairs, apparently in condition for additi pervice

A remarkable car has been brought out by the Schacht Manufacturing Company, of Cleveland, Ohio The car in question is ingratioualy convertible Or-dinarily it is a runabout. By the addition of a surrey seat the runabout is transformed into a four-passenger family car. The same runabout, by the smployment of a special box back, is converted into a tight delivery The vehicle is illustrated on the double page of cars appearing in this issue.

The present four-cylinder Cartorcar may be regard The present four-cylinder Cartorcar may be regarded as an improvement of the former two-cylindor model, without a single radical change. This car will appear in the coming season in two sizes. Both have the Carter friction transmission, the nucleus around which the first Cartercar was built

The most grueling sort of endurance contest in which motor cars have participated are 24 hour races As a rule ont of about fifteen cars starting in these events only five of thom finish at all, the remainder events only five of those finish at all, the remainder breaking down in the occurse of the content from some mechanical weakness. Bomo cars have started in eight or more of these terrific grinds and have never finished once At the 24 hour race bedf at the A Y P Expedition at Seattle, a Hudson "Twenty" electic car weight around the course for hours at a time making mile after mile with the turnout consistency in a 1 15 clip The construction of this car is interesting, when its low selling price is considered. The rear axis is its low selling price to considered. The rear axis is of the semi floating type, shaft driven, and is strongly reliaforced at the points where the greatest shocks and strains occur. Two large double-acting brakes are ed at each end of the rear axis built for the man who is satisfied with a speed of 55 miles an hour The motor, fonr-cylinder vertical, water cooled, is simple, very strong, and amply powerful The transmission is the three-speed sliding gear selective type used on all standard cars.

Mazy an inventor has probably wondered whether the patent law forbids his experimenting with a pair-cated invention. The answer is It all depends upon the character of the experiment. Suppose that an inventor is interested in fring machines, and that his primary object to timprove the Wright machine. Hen he the privilege of holding a Wright machine is limited and fir-privilege of holding a Wright machine himself and firprivilege of miniming a wrught mechane anneath and my-ing it, in order to study time performance as well as to acquaint himself with the art of flying? We think not. He has no right to beside the machine for the purpose of bearaing how to fly or for studying its performance in any way. Had be bessed the machine-from the Wright brothers or their Recesses he would bredly have the right to use the machine in

Jamuan 16 tops

Institute the magnitude and institutes.

Institute in considerable detect, since in each contraint, seems to arrise in regards the 1929 regions to arrise in regards the 1929 regions town and Honesse in different Shides, the Bureau Tower of the Antoncobile Child of American has issue a chart showing past what States require registrating or Honesse for the new year, where yearwhat are necessary, and where the old registration or Honesse for the contraint. As reposed as this dataset we have year. operative. A synopole of this chart for New York, New Jersey, Pennsylvania, Massachusetta, Connecticut, she

Jersay, Pennsylvania, Massaccaserta, Connectert, asse Rhode Island is as follow: New York.—Registration of care in New York State are perpetual on the car originally registered. If car-changes ownership, the new owner must re-register same. If new our is purchased, atms must be regis-tered. Transfers are not made.

sams. If new car is perchased, stans must be registed. Transfers are not made.

New Jersey—Ragistration of or and driving lionace is equited samality and same on the register of the second of the se

certificates of good character and recommendations.

Connecticut—Registrations are annual, expiring D cember 31st Annual driving license required by owner or chauffeur Non-residents axempt for ten days from registration and driving licenses.

Rhode Island —Registration and driving license re nired Fees of registration based apon horse-power residents duly registered in home State are exmpt for ten days.

Riectron—A Mosal Lighter than Aluminians. According to Kosmos, a technical roviow appearing at Portshein, the Orienthe-Michectron works athibited at the aeronautic exposition at Frankfort-or-the-Main its novel patented alloy, the metal "electron," which is claimed to be much lighter than aluminium and at the same time much more darable.

The lightest metal employed for technical pu

up to the present time has been aluminium and som alloys of aluminium, the strength and the durabilit of which are however lower than those of the new metal. The density of aluminium and its alloys has metal The density or atuminium and its alloys ma-been nearly 8, and they are about twice as heavy as electron. The chemical works of Griesheim-Electron has discovered that magnesis is ntilizable for technical and discovered that magnesia is ntilizable for technical purposes. By the admixture of magnesia, the price of which is comparatively low, with one or two metals, an alloy is produced of a density of 175 to 3, possess-ing great solidity, strength, and elasticity, and at the same time readily workable. The color of these alloys reaembles that of allyss, and they possess great some esembles that of silver, and they posse ess great so rous quality

rous quality

The new metal is maid to behave vary well as regards change of temperature, and it responds to all technical requirements, in the air it becomes ceremed with a coating of projective oxide. As cast metal, it does a revisiance up to 18 thlogrammes per square millimeter and has at the same time an extension capacity up to 5 per comit. By the processes of concession, so the same time and the sam ounsation, soon as compression, rolling, etc., the physical properties of this metal, a.g., strength and elasticity, can be materially improved without its density being increased to any considerable extent. We may thus obtain a tensile resistance up to 35 kilo-

ty other increased to any combourable action. We present the property of the present of the pres

name oppose, one worse requires all socks by ger sear; so or electron than or aluminitum. The "Experimental requires 4,500 khigarangules of aluminitum, which origid be explained by 4,500 kilogrammen of aluminitum, which origid be explained by 4,500 kilogrammen grammen of alcotron. A large accountable contribute in mechanism, about 400 kilogrammen of selection, the which could be contained, the selection of the all of the anisotron, by 6th Engineering.

THE MOTOR CAR ARE THE BEAR.

(Continued from gage (7.) out binders tecinde the petro Springarshit binders' faccines the petro-fisure containing an asphalitic been, the presence of runh petroleums, the heavy strength of the petroleums, the heavy strength of the petroleum of the petroleum should be properations. In addition to these, as law special materials have been them, as law special materials have been them, as law special materials have been should be a super factories. In some heat one of the petroleum of the petroleum have been added to oil or tar emulsions to cause the residue upon the road supse the residue upon the road su face to harden after the volatile products have evaporated. Waste sulphite liquors nave evaporated. waste suppute inqueri-from wood pulp have been employed with some success in a concentrated form, and, in fact, the list might be indefinitely ex-tended. The essential requisite in a dust preventive is its binding power, and it naturally follows that the experiments will cover a wide field.

Water, while usually the most abundan and cheapest material, is very often, be-cause of the frequency with which it must cause of the frequency with which it must be applied, the most expensive to use. Its binding power is almost entirely due to capillarity. The value of the sait solutions commonly used lies in the hygro-scopic character of the dissolved sait, which, having counderable affinity for water, keeps the road surface in a moist condition long after a surface treated with water alone would have become dry through evaporation. The light oils and tars, as well as the oil and tar emulsions, are dependent for their effect upon the re-tention by the road surface of a comparatively small amount of true binding bas tively small amount of tree binding base after the volatile products have evapo-rated. This base proves effective only as long as it retains its binding power. When the binding power is destroyed, it is necessary to apply more material. If the base is an exceptionally good one, the accumulated products finally barden the road surface and prevent wear to some

The heavy oils and tars differ from the lighter products in that they contain lighter products in that they contain a much greater amount of asphaltum, which constitutes the binding base. The results are, therefore, of a more issuing characteristics were the second of the sec

natural or artificial The small method of applying these ma-terials to the road surface is hy aprink-ling. The temporary binders can unsulty be applied cold, but the permanent bind-ers, because of their much greater vis-cosity, must be heated nuitl sufficiently fluid in Engiand and France the use of num in England and France the use of coal tar is practised to a large extent and their methods of application have been highly developed. Machines are in gen eval use which are self-propelling and in which the tar is heated and then applied the road surface as a spray under high sours. These so-called "tar sprayers" pressure. These so-called "ar sprayers are not only very economical in the use of tar, but insure a more even distribution and better penetration of the road surface than it is possible to obtain in

imost any other way. In the construction almost any other way.

In the construction of dustians roads,
the crucial question in that of cost. Automobilies have but fittle destructive effect
on paraments, but these are in general
to costly from country reads. The effort
minst be to develop a form of construction
which will withstand has automobile
tresis and at the same then be within the financial resources of the community This is largely being done at present by the use of a bituminous binder instead of the rock dust. The two methods gene-ally employed are known as the superthe rook dust. The two methods guest-stly employed are known as the peactiv-tion and the strings method. In the for-sart, the bot liquid stonder is granitated or spectrum of the string method and allowed to appearage through the weeks stat once the strains smally to a depth of two or three mades. Stone of the devices in was from the blooker bits the root curries by means and the strains and the method of the strains. of heavy of pressure. In the mixing

"This Car Can Be Run 5,000 Miles a Year at an Average Total Cost of \$3.98 a week"

Here is a Big Touring Cur that will interest thousands of men who have always considered an automobile beyond their means-not because they couldn't afford to buy one, but because they have felt they couldn't afford the cost of maintaining one It is true that the expensive "up-keep" of most automobiles has put them beyond the reach of men with moderate incomes. . Not so with the Maxwell. Our cars have always been the most economical to run, as over 20,700 Maxwell owners have proved. Our constant aim has been to make automobiles that the mass of the people could afford to own We have kent right on from year to year improving Maxwells in every smallest detail that would reduce their operating expense-increasing strength and durability, decreasing weight, and simplifying construction

Now we are satisfied that in our new 4-Cylinder, 30 H P. Touring Car we have the great "Economy Car" What does it actually cost to run? This is what the majority of men want to know, and this is just what you don't find out about other automobiles—before you buy them.

BASED ON FACTS

method, the stones and hinder are thoroughly mixed, either by hand or machine, oughly mixed, either by hand or machine, no that each stone is covered with a thin ilm of the binder. This method in gen-eral insures the better and more even dis-tribution of the binder throughout the

The material used for the bitnder varies were largely with different socious in England and France the tare ere used wery largely. In the wester portion of the United States, the heavy asphatic old of Childrenia are need emet excite sively, while in other sections we find that tare, residence of the indica sphalfa, and various proprietary compounds are half or socious of the control of the con

One of the chief causes of the great number of failures which have been re-corded in the use of bitminous road ma-terials is the failure of the user, as well as manufacturer, to understand certain fundamental principles. To many, a tais simply a tar and oil an oil, while in reality there is a vasi difference some-times even in the tars produced at the same works. The oils size range from same works. The oils also range from those of a paradine base to these almost wholly asphattic. Thus a concise knowledge of the character of the product, the process followed in its preparation, and the effect which varying conditions will have upon it is nece avoid costly mistakes.

THE MIDDLE WEST AND THE AUTOMO-

(Continued from page 48) that the freight has usually been edded to the purchase price of the car, and has gone against the consumer, there are many cases in the past, and there will be many cases in the past, and there will be many more in future, where the cars are sold directly at the catalogue price. For that reason, the location of factories in the middle West was ideal, for it is in truth the center of the automobile-buying

In some cases, cities have been made over and their population doubled and trebled by big motor-car factories, as in the case of Filmt, Mich, and New Castle, Ind. Such cities have had a (remendous boom in real estate, and in husiness gen erally, owing to the influx of 2 000 to 5,000 families, and have assumed an entirely dis ferent position on the map because motor-car factories were established within their limits Besides supplying employment to laborers in large numbers, much money has been made by the leaders in the vari ous enterprises. This has been especially ous chterprises. This has been especially true among the makers of wheels tires, frames, and other parts in a general wey it may be said that the parts makers heve made more money than the automobile builders, as the latter have expended greater sums of money in experi-

The total capital of the automobile menufacturers in this country is about \$225,000,000 The actual value of the plants will run into some extraordinary figures, and these values are rapidly in creasing As for the output for 1910, it is likely to exceed 200,000 cars, although there may be a slight failing off from these figures, owing to the inability of parts makers to supply the demand or parts makers to supply the demand.

There are now about 150,000 automobiles in use in this country. In a general way, it may be said that the employees number some 120,000 fm motor or factories. it may be said that the employees num ber some 120,000 fm motor our factories with employees in parts factories reach ing not less than 40,000, a total of 160,000 ing not less than 40,000, a total of 160,000 America may be safely considered the home of the low-priced car, a condition brought about by the tremendous buying power of the middle classes, who denamd a car which can be cared for by the owner without the aid of an expensive chauffeer.

These to worked was have been made

These low priced cars have been made ible by ideal factory methods at production This necessitated their being standardized, something that may be said to be original with the American maker, to be original with the American maker, who feels that eny one of ten thousand parts should be made to fit eny one car turned out by bis company By working on big productions and

HOW TO OVERHAUL A CAR

NOW TO OVERRATE A CAR

(Continued from page 53)
son for this is that the shafts, especially ger shafts wear down and
must be ground true and no manu
matchners seem to appreciate the useful
ness of boring repair bushings slightly under size The plict husbing being solid be specially made to suit the chaft Aside from this one a skillful amate can meke e good job of acraping his own husbings if he has a suitable set of scrapers and time and patience. Hed lead is used to test the fit. Of course the gear case n ist come out of the car and at intervals the bushing caps are boited down tight and the shaft turned to de whether it is tight or free and whether it makes contact all over

In refitting gear shefts and bushings it is necessary not only to achieve a proper fit but to keep the shafts absointely parallel If they are not the

best result is naturally gained by replac-ing b th mating gears if either is badin ing h in mating sears if either in badly wors aim othersise the new years would have to run against a had profits and would west sway sooner if the car has aid casts drive the differential shart dustines will need refitting at the same time. The parts of a differential which wear feature are the husbings A of the sur or beval printed B (Fig. 8) since these are the hardest things to inbricate
To take the differential agant it may be necessary to file the ends of heeded over through boits holding it logether in that through boits holding it logother in that case the nuts should be reduced in thick came the nuts should be reduced in thick ness so that the boits can be headed over again on resasembling (The boits in Fig ' do not go through) It is very important not to give anything about the differential the slightest chance of work ing loose and the same applies to the boits holding the change gears. Another point that is difficult to oil and therefore liable to cut is the bearing (between tho differential or geer hub and the sleeve into which the hub of the differ ential shell extends. This sleeve runs in plain ur ball bearings in the case with the shaft or gear bub turning inside of it whenever the car goes around a turn Booner or later new hushings are

If oil is used in the gear case as it must be if piein husbings are used in steed of ball bearings it becomes something of a problem to inhrical, the hear ings effectively without excessive leak age of oil the writer solders a thin wire age of oil the witti solders a time wire games screen (Fig. 6) over the interior oil pockets to exclude steel grit worn from the gears. In order to prevent es-cape of oil from the ends of the bush ings e felt ring is necessary (Fig 6)
This ring would cause he oil near it to
become stagnant were it not for a special DOCUME SEARCH WE'VE IT NOT TO SPORTS.

OIL STOOM BY WHICH SHOULD BE ADDRESS.

WITH A STOOM OF BY WHICH OIL SHOPE OF THE CAMP.

But for this provision particles of dirt. tetting into the end of the bearing would accumulate and cut the shaft

In the rear axis of a shaft-driven car the thing most likely to need rejlacement is the differential there ere various ways of guiting at it depending on the design of the axio casing. If the axie is divid d verticely in the fore and aft cen-tral plane the rear springs must be jucked it and disconnected from the axis d th baives of the axle drawn as and it have, or the axio drawn assumers after taking off the wheels. A better or rangement is to have a removable cover plate on the asing through which the differential is instrict and withdrawn. This is found especially in exics of the This is round expectany in exist of the finaling type with wheels running on ball or roller bearings on the ends of the exist tubes and driven by floating shafts extending from the differential to jaw clutch plates ungaging the outer ends of the wheal habs. To remove the diff ferential the hub caps are first rem

ferential needs overheating. By Jacquise up one rare wheal and rotting it black and forth, the total angenit of sized in and forth, the total angenit of sized in the differential may be epithemated. It is also usually possible to reach the platent through openings in the differential shell, and by shaking them to determine whether they are looss. If po, they should be revealed and the phas or spider replaced it were. Prospensity planes are placed in the property of the prop the gears should be moved in a straight line and not canted ground, also the teeth will engage only at their small or large ends instead of over their full length. By rubbing red lead on the teeth and turn ing the gears, one can tell where the teeth touch

if cup and cone ball bearings are used ir cup and come ball nearings are used whether in the rear axis or in the trans-mission any worn parts should be re-newed immediately Fig 7 shows the effect of wear on a stationary ball cone, effect of wear on a stationary ball cons. of g on an axia spatial the pressure comes against the stationary bottom portion and while the cup were a true path the cone is destroyed. It is possible though not always worth while to be though not always worth while to a quarter or half tern on the shaft or axie if the cup is stationary and the cone rotates evidently the cup will be first to wear out of round When one ball of a set is reserved the entire set should be replaced with it.

We come now to the engine the last and in some ways the most difficult part to overhaul The owner is strongly ad vised not to attempt to refit the main crank shaft bearings unless he has had considerable previous experience and erank shaft bearings unless he has had considerable previous experience and knows exactly what to do On the other hand it is not at all hard to regrind and readjust valives replace wern value illuser and the guides and to do or dinary tiskewing and adjusting with the limer arborrer of it is best not to tamper with the magneto turther than to clean the interruptor and adjust the

to clean the interrupter and adjust the interrupter coincide points if worn To overhaul the engine first strip it of all small gear Take off the magneto first marking the coupling so that it can be replaced exactly as it was and tag the wirrer Remove and tag the oil pipes, blow through them to see that they are clear and ping them to exclude dirt. Descenaet the carburster remove the Descensed the carburster remove the timer take out the spark pings and ping the holes with waste remove the dust pan take out and mark the valves take off the water pipes, the pump, and the fan Now take off the cylinders If no tan Now take on the cylinders if the further dismantling is contemplated the piston heads may be scraped as sits taking care that none of the earbon falls into the crank case and the piston rings are likewise cleaned without removal if illie If the rings are leaky as prov

the miles of the wrige are sense. It is a sense of the property of the propert oranz pm resur will in time were that at the point of greatest presenting, as indi-cated in Fig. 9. It takes more skills than can be dequired off-hand to time it up again, but it can be done with a fine

Swiss its and calipers. It is not neces-sary to file clear around the unworn por-tion of the pin, aloce a slight devia-tion from its original axis does no harm, neither is it absolutely essential that it should have the same diameter through out. Its new axis, however, must be ab-solutely parallel to the shaft. It is best to throw away worn bushings and put in new, taking out or inserting shims till a fit is obtained, and scraping no more than is necessary A worn wrist pin bushing must be renewed, and usually the possing must be renewed, and usually the wrist pin must be ground true. If the crank pins are olled through passages oranne pins are olled through passages drilled in the crank shoft, their lubrica-tion is probably perfect. If, however, they are olled solely by aplash and the oil holes are in the upper haif of the crank pin bushing, a considerable im-provement can be made by replacing the upper bushings with solid ones and in upper bushings with solid ones and in trodding the oil through the bottom half by brasing a copper tube in the cap to act as an oil ecoop (Fig 10). The bot-tom half is then drilled and provided with an oil grove for about half its length. It is a principle of inbrication that the oil should slaway be introduced at the unfoeded side of the journal and that any breaks in the continuity of the loaded surface merely afford the oil an avenue of escape under pressure To renew the clutch leather, take off

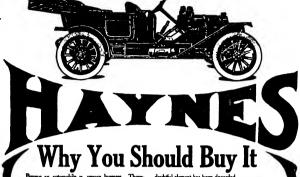

the old leather and use it as a pattern Select the new leather carefully for uni Select the how teather carrently for uni-form and correct thickness, and cut it about half an inch short. The curva-ture should be approximately that of the old piece (Fig. 11). Locate the end and the middle holes for the rivets countersinking them considerably so the rivel heads will not come flush, and soak the strip in water this it has swelled suf-ficiently to go in place. Use the end of a steel Bar sa an anvil, and put in the end and middle rivots first, holding the strip meanswhile hy wire nails. The riveting must be completed before the strip dries. The riveting

CLEANING THE OILING STOTEM it occasionally happens that the offing lickening of the oil or the introdu

In the majority of cases this ma leared away by draining the oil from cleared away by draining the oil from the tank and crank case, putting a plut or two of gasoline into the tank, and cranking the engine briskly The gaso-line will thus be forced through all parts of the system, and will cut out the thick oil and dirt. Before rediting the tank with oil, the gasoline should be drained out and time allowed for it to drip out of the piping

of dirt and grit.

CUTTING A GARKET

To prevent the leakaga of oil the cover of a gear case usually rests on a gas-ket, which may easily be injured or destroyed when the cover is removed. Its replace, but as a matter of fact it is a testion of only a few minutes work replace It

The material to use is smooth and un creased brown wrapping paper of me dium weight, and of a surface that is no dium weight, and of a surface that is not too highly glazed. Clean the top of the guar box and lay the paper over it, then with a light hammer tap the paper where it rests on the outer edge of the flat part. The edge cuts through the paper where his hammer arrikes, and to get the gasket to proper shape it is only necessary to follow the edge all around To prevent the slipping of the maper, the to prevent the slipping of the paper, the first step might well be lo cut two boil holes through it, and lo leaser the boils. The holes are out by striking the paper over the boil holes in the gear case, using the ball end of the hammer.

The inside opening is cut in the same manner as the outside Before applying the gasket, give one side a coat of red lead and the other a coat of sheliac, and in placing it in position have the shells side down, or in contact with tionary part The gasket will then cling and will not be forn on any sub-sequent removal of the cover

A gasket made in this way will give excellent results under the detachable bed of a marine or stationary engine, hut after fitting it the engine should be run sufficiently to get normally heated before finally setting up the nuts or before finally setting up the nuts or bolts that secure the head to the cylin-

Aside from its unsightliness, a dent in a tube, radiator housing or other metal part may interfere with operation, and it becomes necessary to remove it To do this form one end of a piece of stout copper wire into a loop, and solder it to the lowest point of the dent. Then exert a strong and steady pull on the wire, at the same time tapping the borders of the dent with a light hammer. When the iont is thus pulled out the solder may be melted off and the finish restored with

ne emery and crocus cloth.

A dent in a gasoline tank is more dif A dent in a gasoline tank is more dif-ficult to remove on account of the great-er siffness of the metal, but it may be accomplished by the uso of a discarded valve. Clean the valvo head with emery valve Clean the valve head with emery cloth and solder it, not to the bottom of the dent, but to one of the aloping sides. The valve stem then forms a sort of lever by which the dent may be

The copper and brass piping used for soline and water connections has a passine and water connections has a tendency to spill, and an injury of this sort apparently calls for a renewal of the part. This, however, is not always necessary, for a permanent and sightly repair is a comparatively simple matter.

LINING UP THE WHENA

LIKEUR OF THE WEIGHT.

While it is not generally realized, yet it is none the less true that the failure of tirse to give good service is in many cases due to the wheels being out of like. This may be caused by minadjustment, sprung steering-rod or arms, a wide in the axis from road shocks, all of which result in the rother the whoels of the product of parallal with the context like out of parallal with the context like out of parallal with the context like of If the wheels are set corre they will have a true rolling motion on the road, and the slightest deviation from this position will set up an additional silding action that is destructive to the

tire surfaces.

In testing the parallelism of the wheels
it may be taken for granted that the side
members of the frame, as well as the
syrfugs, are parallel Surfug with a
rear wheel, measurements should be made of the distances between the spi and the forward and rear portions and the forward and rear portions of the felice, at points an early as possible on the level of the axis. These measure-ments should be equal, and should be the same as corresponding measurements made on the opposite side of the car. If the figures indicate that the wheels are equally out of parallel with the springs.

equally out of parallel with the springs, matters may be set right by making a proper adjustment of the radius rods. To test the front wheels, manipulate the steering gear until measurements how one wheel to be parallel to show one whoel to be parallel to its spring, it will be necessary to adjust the storage arms of the two chunchies. Another method of testing fine whose is to stretch a string along the sides of a front and rear wheel, just above the actie. With the steering pare set for straight running the string should turned. straight running the string should touch each wheel at two points, as indicated in the diagram If the wheels are not true, the string will touch at one point only se illustrated

The writer was once called on to lo-cate a knock in an automobile engine be-longing to a doctor There was no ques-tion as to the cylinder, nevertheless even the use of a stiff wire, one end held in the teeth and the other resting against the engine, failed to determine whether the trouble was in the crank pin or wrist

The sight of a stethor The signt of a sustroscope in the coc-tor's pocket suggested its use, and the knock was immediately located in the wrist pin. A stethoscope now takes an important place in the writer's testing important place in the writer's testing coulpment, and he believes that it will be found invaluable in the repair shop by its use locences in a ben'ing may be detected long before it becomes services, again agree may be head blasting past worn platon rings or pitted valves, and other noises that indicate alight half of the property of the property

AWonderful Business Story

We have told in a book-which we ask you to send for-one of the greatest business stories ever told. A story of how John N. Willys stepped in two years to the topmost place in motordom. Of how Overland automobiles rose in 24 months to this year's sale of \$24,000,000. How a factory has grown like magic to a payroll of 4,000 men-to a daily output of 30 carloads of automobiles. And how a large part of the demand of the country has been centered around one remarkable car.

The Discovery

Here is an outline of the story-just enough to make you want it all

Two years ago, Mr John N Willys was a dealer in automobiles There came to him one day a remarkable car—evidently the creation of a mechanical genius. The simplest, sturdiest, smoothest-running car that anyone around there had seen

The name of the car was the Overland And the price-then \$1,250-was as amazing as the car itself

The sale of this car spread like wildfire Each car sold brought a call for twenty others like it. Old and new motor car owners came by the score to deposit advance money-attracted by the Overland's matchless simplicity

But the cars did not come And when Mr Willys went to the makers he found them on the verge of receivership.

The genius which had created this marvelous car could not finance the making, in the face of the 1907 panic.

The New Start

Mr Willys in some way met the overdue pay roll-took over the plant-and contrived to fill his customers' orders.

Then the cry came for more cars from every place where an Overland had been sold. As the new cars went out the demand became overwhelming. outgrow

Anoth but the

Dura sent ou mand w

Dealers fairly fought for preference. Buyers paid premiums. None could be content with a lesser car when he once saw the Overland

All this without advertising. About the only advertising the car ever had was what users told others

The Pope-Toledo Plant

Mr. Willys' next step was to buy the Pope-Toledo factory-one of the greatest automobile plants in the country This gave him four well-equipped factories-just 16 months from his start

But the Toledo plant wasn't sufficient So he gave his builders just 40 days to complete an addition larger than the original factory

Then he equipped these buildings with the most modern machinery-with every concervable help and convenience—so that cars could be built here for less than anywhere else

Now 4,000 men work on Overland cars The output is valued at \$140,000 per day The contracts from dealers for this scason's delivery call for 20,000 cars

Now this man has acquired 23 acres around his Toledo plant. And his purpose is to see -from this time on-that those who want Overlands get them

Marvelous Sales

The \$1,000 Overland

This year an Overland-better than last year's \$1,250 car-is being sold for \$1,000 That is because the trainendous production has cut the cost 20 per cent.

A 25 horse-power car, capable of 50 miles an honr, for \$1,000, complete with lamps and magneto Never did a maker give nearly so much for the money.

There are higher-powered Overlands for \$1,250-\$1,400-\$1,500 They are just as cheap in comparison as the \$1,000 model

The Overlands are unique in simplicity They operate by pedal control A ten-yearold child can master the car in a moment

They are made in the same factory, and by the same men as made the Pope-Toledo-a \$4,250 car The reason for the price hes in the production of 125 cars per day

Get the Whole Story

Send me this coupon to get the whole story, told in a fascinating book. Learn about the car which in two years captured so large a share of the whole trade of the country See what has done this-what there is in the Overland to make it the most desired car in existence Please cut out this coupon now.

F A. Barker, Sales Manager,

The Meterley (Letting Pro) of Are Solved to College Lange

For every motor vehicle need there is a Solar-and it's the quality lamp for the purpose.

Solar quality persists throughout the line. It is as strong in the smallest side and tail lamp as in the largest headlight.

Why take ordinary lamps when the manufacturer will furnish Solars if you insist? The manufacturer knows their value as well as you do, but they cost him a little more. They are built for your—not for him.

Then there are Special, unique Solar Lamps for special needs of the Motorist.

There's the Solar combination gas and electric headlight-both illuminants interchangeable.

There's the Solar combination oil and electric side and tail lamp, the only satisfactory solution of that end of the lighting problem

There's the Solarchpse, the two-ray light projector, giving you in one lamp a search-ight beam and a nearby illumination.

There's the Solar Raydeflector, r driving single-focus headlights out of use.

But send for our full descriptive catalog. It's free, and it's one of the most interesting booklets the motorist can read

Sending a message is only half of the transaction. The other, and equally important, half consists in getting back the answer.

Sometimes this is a reply to a question, or the acceptance or rejection of a proposal. Sometimes it is simply an acknowledgment that the message has been received.

The value of the message depends upon getting an answer.

When a general manager sends word to a representative in a distant city, he wants to know that his

ADAPTABILITY OF THE STRONGSTO CAR TO BATEROAR ARRYICE

RENNAN and Schart, each working independently of the other, have recently proved that a car constainting a plat of gyroscopes can be ruf upon a single rail end maintain its stability under varying conditions of eventric loading, side wisds, and curving track. Upon seeing a practical demonstration of this fact, and submitting the rail. See the writter recently did, to various severe and successfully-answered testing the second successfully-answered testing the second successfully-answered testing. and successfully-endured testa-it is natural; in the first motean of enthusian to proded an immediate and widebread application of the system, or even the eventual handonment of the present twe-rall track and trades in favor of the monosuli type Sober mod though, however, must confuse any thoughtful and practical mind that, in spite of the brilliant results of the recent demonstration, he monorall grocessing of the production of the product wopie car, in the nature of inings, can have only a more or less limited application under presenting, conditions. We wish it to be distinctly understood, of course, that any criticisms which follow are in no sense heatile, and are made with a full appreciation of the skill and knowledge, both theoretical and prac-tical with which the car was believed to the little of the skill and knowledge, both theoretical and practical, with which the car now being shown in this

city has been developed.

The Can—Mainly because of its perfect adaptability to take the curves, whatever the degree of sharpness, with a minimum risk of devaliment, the promoters of the system claim that trains of this type will be run what minimum makes of sevalues the promoters or as a speade from fifty to one hundred there can remain than those that are possible on two-rail track. Now the sevalue is to complete with the old, the invalue must provide at least the same expactly and countor as the present Pullman trains. It is stated that, in such cars, the weight of the groccopes will be of the present pullman trains. It is stated that, in such cars, the weight of the groccopes will be not present pullman to a present pullman to a present pullman to a present pullman to the present pullman to the pullman trains. It is stated that, however would be lightness by the reduction of the number of wheela per truck from six to say four, and as the sailes would be shortened, it is proble that the weight awe'd in this way would be about of the number of wheela per truck from six to say four, and as the sailes would be shortened, it is proble that there would be any reduction in the weight that there would be any reduction in the weight the there hand, we would be one reduction in the weight the there has no would be any reduction in the weight of the care as e whole. The groccopic mechanism, on the hear hand, we would be an extra cost and certainty not there has the would be one reduction and and the present the present the results of the care as evalue are care and extending the color of the number of the present the care of the present t other hand, would be en extra cost and certainly not a very light one. In the very nature of things, it other hand, would be so extra cost and certainly not a very light one in the very nature of things, it are lightly not to be a very light one in the very nature of things, it is not to the result of the result of

ter is reached, it would be advisable to incorporate it.

The Track —Although the claim which is so frequently made that there would be a simplification of

the treek and it issueshing of his cost in particular to the freek three defrantings report to the properties of the pro

posed speeds of one hundred miles an hour and over,.
In the case of long-pain bridges, the concentration
of the weight on the conter of the floor would spill for
the results of the content of the floor would spill for
case of deck bridges where the floor is laid upon jie
top chorfs, the truesse or jaints girders might, be
brought somewhat closer legether.
The cost of unstatemance would undoubledly by con-

The cost of maintenance would undoubledty be con-siderably reduced, since the labor entailed it is temping two rails to gage and it maintaining the proper super-elevation of the outer rail to accure would be entirely eliminated. On the score of safety, provided a sub-able form of track were built, the argument is entirely in favor of the greecopic our, and especially so on the

turves.
It seems to us that if there is a future for the new system, it will be found in the construction of ploneer rallweys through undersloped country, and particu-larly through mountainous and hilly country where traineys invogas unsystematic country, and parties alrely through montalsacopu and allily country where solicalizating qualities of the car essale it is never as a considerable of the car essale it for an around curves which would be altogather impossible for a two-track railroad. The monoral track could be located around a bill or bill, through which a two-track railroad would have to pass with heavy and carponalve excavation. Moreover, for this class of railroad a much lighter car would be practicable and or tremty high speeds would not be demanded. This decrease in weight and speed would most a great remote just the contract of the speed would not be demanded. The decrease in weight and speed would most a great remote just the contract of the speed would not be demanded. The decrease in weight and speed would mean a great remote just the contract of the speed would be contracted. The contract is the contract of the speed would be produced to the speed with a speed of the speed would be produced to the more important lines of travel, and oversually, it is que main truth roles of travel, and oversually, is the main truth roles of travel, and oversually, is the main truth roles of travel, and entually, to the main trunk roads

INFORTANT INVESTIGATIONS EDGARDUTE THE PROPERTY OF SELFA.

M PROPERTY investigations, marking a new era in the study of the propulsion of ships, are about to be undertaken by the Naval Architecture Department of the Massachusetts Institute of Technology, notice the direction of Frod. Cacil B. Peskody's based of the department, and a corps of samplatoria based of the department, and a corps of samplatoria.

Airendy a navigable forty-foot model is in pro-Already a navigable forty-foot model is in process of construction, funds for the unintenance of this work being previded by a friend of the department, in order that the investigations may be of a president nature, directly connected with the actual conditions of ship propulsation, the model is being patterned after the U S. S. "Attanting," and will be on a co-stift, scall. The choice of the "Manning" as a type of ship for the experiments is made because Prof "Babody, substitution of the Control of the Control

tenis" and "Lustranis" Mesers. Denny Brothers of Dumbarios, Maghaid, have a private model basis in which they have devided now of the passes werend, the "Okaki," which was bettle by this first, passes werend, the "Okaki," which was bettle by this first, just such a narrigation model was used to determine the canacity and power of the novel, combination of re-irprocating angients and lever-private trifficials. The department has been promised the posperation of the model health of the Weldmann and York, and the preliminary topic age to be middle libers viety doin, the N

casily transversed to ornar natio as new wars, pro-gresses.

Upon the completion of experiments with the should built and equined to correspond with the privileype, various forms and incations of propelars with its pro-parisonness good, belieflagt virt and driple-covery pro-parisonness good, belieflagt virt and driple-covery pro-parison to the property of the state of the pro-parison to the property of the state of the pro-tine turbuled by the property of the state of the changed so far a may be written redulfing, and the hulfs of various forms of shipe will be built to expend the contract of the property of the property of the pro-tine turbuled by the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the pro-teed of the property of the protect of the pro-teed of the property of the pro-teed of the property of the pro-teed of the protect of the pro-teed of the protect of the protect of the pro-teed of the protect of the protect of the protect of the pro-teed of the protect of the pro-tect of the protect of the

The question of using low-tension metal finness iamps in receiving considerable attention abroad. Transformers are being made for this particular pur-Transformers are boing made for this particular pur-pose, which are fitted with interruptars, so that they may be used on direct current lines. It has been sug-gested to fit each lamp with a transformer The fila-ment of the lamp could be a closed circuit, forming the secondary of the transformer

A simple method of clarifying the air of a room has recently been suggested. It consists of an elec-tric fan or ventilator, which is operated in a cylinder and from a reservoir above the fan a liquid is air lowed to drop on the fan blades. This is thrown out against the cylinder in a spray, through which the air drawn by the ventilator must pass. This serves air drawn by the ventilator must pass. This serves to collect the dust from the sir. The inventor of this system proposed the use of streerine or scapsuds, but it has been found that practically as good results can be obtained by the use of water.

A novel method of catching fish was described in recent issue of the Electrical Review and Western Electrician. A trolley line running between Frank lin and Columbus, Ind., skirts the White River for a lin and Columbus, ind, skirts the White River for a considerable distance, and it has been discovered that the trolley wire is frequently tapped to furnish cur-rent for fishing by electricity An end of the wire is placed in the water, and the current stuns such is piaced in the water, and the current stuns such fishes as come within its influence, so that they can be taken out with scoop sets. The trolley company and the Iudiana Fish and Game Werden are trying to break up this method of fishing.

The following estimate of the value of various electrical industries in the country during 1909 has

published in the Electrical	Werld
Diectrical apparatus	\$275,000,000
Diectric rallways	475,000,000
Central stations	250,000,000
Felephony	250 000,000
relegraphy	69,000,000
solated plant supply	75,000,000
discellaneous	. 50,000 000

\$1,435,000,000

The value of aluminium for the field coils of rai way motors has been tested in Germany It is faund way motors has been tested in Germany it is fenal that the aliminium takes up less space than the cop-per, although a larger mass of metal is required, be-cause ne covering is required. The oxide film on the simulatum provides sufficient insulation and there is samming provises summent issuances and there's no danger of destroying or weakening this insulation by observing as in the case of the cotton covering when the motor is overheated so that there is less dan-ger of short circuits. The principal advantage, how-ver, is in the reduced weight, as the aluminium coils weigh but half as much as the copper coils.

A writer in La Revue Electrique describes the en A writer in La Revue Richtique describe the or puriment of Richtesia Kernbaum to determin the ef-termine the Richtesia Kernbaum to determine the following the Richtesia Richtesia Richtesia Richtesia curry vapor lamp, and after short ten bours gas ap-peared to be forming. At the end of two hundred bours 360 cubbs millimeters (0 916 cubic luch) of gas was produced. The gas proved to be hydrogen, while the water showed that it was oblarged with oxygen the water showed that it was charged with caygen This apperiment explains the presence of caygenated water in anow and rain. It is proposed to use this method for sterilizing liquids, as caygenated water is an excellent germicide.

Now, that serial navigation is coming to be con sidered seriously new problems are arising, such as the question of navigation on stariess nights er over fog bound land, when the aeronant will be unable to rog count issne, when the seronaut will be unable to find his bearings. It has been proposed by a therman inventor that a network of wiveless stations be es-tablished over the land, each automatically sending out a predetermined signal at regular intervals, which out a producerimize against a regular intervals, which would be received by the air craft, and enable the aeronant to determine his course. The airships would not be required to carry transmitting apparatus, as a small receiving apparatus would suffice to enable them to avail themselves of this proposed system, and the weight of the receiving device could easily kept down to a few pounds.

the wagnit of the receiving series count easily to apply down to a two pounds.

SCIENCE

Prof. E. E. Barnard of Yorkos Observatory has succeeded in obtaining a photograph of Halley's comet which shows a faint slender straight tail Ho far as is known, this is the first photograph to show the tail of the present returning comet.

A new estimate of the earth's age has recently been given by Prof William Morris Davis of Harvard For the usually accepted one hundred million years he estimates sixty million, based on an examination of the eliffs in Arisons and Utah where the time taken posit the strata can be easily come

One objection to glass roofs is that if they are not very steeply inclined, the water of condensation collects on their under surface, and instead of running down along the separating ribs of the panes or plates, and along the separating ribs of the panes or plates, and being ried off, drips upon persons or objects below, which is inconvenient and may be very expensive New where the panes or strips are abort, the path to the trough is too leng. The increase in length and width of the plates new used makes this difficulty of more and mere importance each year. One way of setting around it is, powers, similar to that employed systing around it it, powers, similar to that employed gatting around it is, however, similar to that employed in ferests and parks to prevent washing away of the hillside paths, namely, making inclined grooves to-ward the sides, only in this case the grooves are of hereachee shape, and form a series of parallel corruga-tions which carry the drops to the ribs which separate the plate, they then fellow these without much culty down the slant to the trough below. This sys may be employed either with glass sheets in wire is embedded or with plain plates.

We notice in a recent number of the Medical Record a letter from Dr Robert I Watkins, New York city, in which he claims the credit of having applied the movwhich as claims the credit of naving applied the mov-ing picture to the microscope. He states that as far-back as 1897 he demenstrated the machine to a private anddence, among whom was the Rditor of the Scien-Tific Assexicant The machine, known as the "micro-motoscope," was described in our issue of July Sist, notoscope, was cere-post in our issue of July 31st, 1897 Later, microscopic meving pictures were exhib-ited at the Grand Central Palace during the Trained Nurses' and Pure Food Exhibition, the pictures throws on the screen exhibiting the circulation of the blood in the web of a from's foot, rollfers in stagment water. in the web of a frog's foot, rottlers in stagmant water, an amabold leucoryle, typhold fever germs, and many others. Since that time Dr Watkins has greatly im-proved his routh apparatus, and gave a demonstration on June 17th last at Chicago before an andience of five hundred physicians of the National Evicatic Asso-ciation We may venture to point out that Dr. Comanden employs not the ordinary mirroscope but the

The third paper deating with the results of the Smithsoolian African expedition under Gol Theodore Rosseverth has just been insued by the Smithsoolian Institution it describes a new species of Octopes to which the specific names of referents is given a remainable of the specific names of referents in given a remainable of the properties of the properti staff to differ slightly from Octorson megalotis, which occurs ferther south, uspecially in color and in the tharacteristics of its teeth and skull. The octocyon is peculiar to Africa, and is not represented in the United States, but resembles in color the swift or kit fox of states, out resembles in coince the switt of this new form closely resembles that of the gray fox of our native fauna. This anneuncement is of special interest for the reason that comparatively few new forms were expected from this region in Africa as the territory up to this time explored by the Smithsonian African expedition has been pretty theroughly examined by

The water bottle for getting water fer analysis from selected depths in the cocan is a cylinder of hrass, German silver, or other metal which resists the cor-rosion of sea water, generally about twe inches in dirosum or see water, generally about twe inches in atemeter and twelve or fourteen inches iong, with upward-opening valves at the top and bottom, connected
together on a central stem. Lugs are cast on the side
of the cylinder for conveniently securing it at any
point along the length of the line by which it is to be point atong the length of the line by which it is to be lowered into the see During the lowering of the line the valves of the bottle are kept unesated by the pass-age of the water through the cylinder during its de-sent, but, when the metion is reversed, the valves seat themselves and are locked by the descent of small propeller in the framework above the appet valve, which ridges slity on a sieved during the lowering of the bottle, but descends along a serve thread to press the valves upon table seats when the line com-mences to be banded up. A specimen of the water at the law brought to the surface confined within the bottle, and a series of specimens from different depths may be obtained at one hand by securing a series of water bottles at the required intervals along the sounding line.

THE SCHERL GYROSCOPIC MONORALE

THE PRINCIPLE OF ITS OPERATION

Within the past few months Mr Brennan has ex hibited at London a car whi h runs npon a single rail and is prevented from fail ng over to either side by the resistan c of two gyros of ex carr ed on the car At about the same ime Mr S herl a German capital ist exhibited in Berlin a similar ar B ti cars were

The gyroscopic car inclines automatically to the

ried their loads successfully and in on h ase the gyroscopes maintained the car in a state of equilibrium—and they did this even when all it e load was placed to one side of the car or when the car was running d a urve

Apparently the inventors worked quite indepen of each other and it is a remarkable fact that in the essential elements for the control of the gyroscopic, mechanism they should have produced machines so broadly identical. The G rman car which is now be ing exhibited in this city represents the joint labors of Mr Ia i Freeli h the inventor who worked out

(Phys. C. 1979). A state of the leaded side, if actually inclines away from it. This, however, is in agreement with the facts observed in our consideration of the greencys, where the pressure on one till the pressure of the pressure is the state of the pressure of the pressure in the unknowled condition of the car the greences were bolding it in a state of equilibrium with the consist of gravity varietal above the rail. When the senier of gravity vertical above the rull. When the hurse people slepped upon the oar the center of grav-larse people slepped upon the oar the center of grav-larse people slepped upon the oar the center of grav-larse people slepped upon the center of gravity of the state and the last until the center of gravity of the one and the three people was directly above the rad and equilibrium was restored 80 essattives the rad and equilibrium was restored 80 essattives the rad and equilibrium was the term in the relation that they begin to not immediately upon the contents of the state of equilibrium, they skert just the right amount of errestors force) and they become quiescent the sement equilibrium, its restored.

Another of our pholographic riews above the strik

moment equilibrium is restored.
Associate of our photographic tiews above the strik
hig bleacemans of a circ running around a curve upon
a stagle rail and inclining investig to the proper de gree to maintain the equilibrium. To practical rainread
mess this is overtainly the most attractive feature of the investion for it would mean the elimination of all the difficult contradictory and expensive problems ochiected with the super-deveation of the orticle rail or the present two-rull irredue. It is a fact that the car to so intelligent (we cannot help using the term) that whether the curve be easy or snarp and whether the car rounds it at ten or seventy five miles an hour it will lean inwardly with mathematical certainty to the exact amount required by its speed and the sharp

the exact amount required my its speed and the summer ness of the curre.

In the standard system of track the component of centrifugal force tending to hard the car over to the outside of the curre or cause it to jump the track is equalized by elevating the outside rail until the rent of gravity and centrifugal force falls normally a track. This condition can only hold true on any to the track to the track This condition can only hole true on any given curre for a certain speed Below that speed a train will grind on the lower rall above it will crowd against the outer rall. Not so with the groscopic car As soon as it enters a curve the pull of centrifu

car As soon as it enters a curre the pull of existing gli frore is resisted and the gyroscopes draw the car over to the inniée of the rail until the resultant of all the forces acting upon it passes through the rail. The gyroscopic car as above described is one of the most brilliant invancions of this or any ages But is it practical and will it pay. A discussion of this question will be loaded in our elitorial columns.

THE BEATH OF LEGH DELAGRANCE

After making a wonderful new record of 124 miles in 3 hours and 33 minutes on December 30th with a Bleriot monoplane Leon Delagrange who with Hour Farman was the first aviator to make flights with the crude Voisin biplane in France in the spring of 1907 et his death by a fall with the same mon met his death by a full with the same monoplane on January 4th while Stying at Bordeau. Our photo-graph shows M Bleriot with Delagrange standing at the left and Le Blanc another during pilot of the stands the machine which to like that Bleriot used is crossing the Channel and which Delagrange used on the day of the scrident A rather strong wind was blowing and according to cable reports when the machine headed into the wind the right wing sendently robe and the monoplane full to the ground

Scientific American

This is the first notified which has occurred owing to the collapse of an aeroplane when in the air We underscand, heavewer that come time up a similar accident happened to Latham, but without disastress results. One with of this Autointells monoplane the off and atood almost at right angles to the other wing of the justification monoplane to the property of pleaning is one side and warping the remaining wing. Latham was able to guide his machine down in circles and bring it sately to the grand dater requiring the wing he attached it in such a

BLERIOT AND HIS TWO PILOTS IN FRONT OF HIS NO 11 TYPE MONOPLANE

way that when he was up in the air he could putl a way that when he was up in the air he could pull a cord and cause the wing to break off as before He did this and tame down a second time with the wing broken simply to demonstrate that a broken wing did not not essartly mean disaster in the Antoinctte ma not not essentily mean quasarer in the Antoluctic ma-chine the wings are secured separatily to a must so that the breaking of one does not affect the other in the Bierich monoplane the wings are connected to-gether over a tripod the result being that if one breaks the other collapses and the machine is sure to be dashed to the ground

The death of Delagrange will put a damper upon the arder of some enthusiasts for a time but it was due to one of those unfortunate accidents which are always liable to occur in the development of a new art ris mame will go down to nistory as one of the martyrs of serial navigation He is the fourth aviator to be killed within the past four months the others be ing Lafebvre (who plunged to earth in his Wright machine) Capt Ferber (who struck the ground when er (who struck the ground when s Voisin) and the Spanish tallor machine) Capt Ferber (who struck the ground when making a turn in his Voisin) and the Spanish tailor Fernandes (whose small biplane resembling the tur-tism broke white he was making one of his first lights on December 6th hast). All four fatal accidents curred in France

A HEW RIGHLER TRIPLARE
One of our itiustrations shows the new triplane of
Mr A V Roe Mr Roe is one of the most persistent Mr A V Roe Mr Roe is one of the most persistent English axperimenters He has been working a long time and has finally developed a successful machine like triplase is ensuly a Langier type machine in trip-itate since it has tirre superposed surfaces forming a tail and attached like the forward places to a tri angular body. The motor is mounted in the body at the front end of the machine and drives a time bladed propeller mounted upon its crummhaft. The aviator sits in the body about half way between the main planes and the following planes or tail. The machine is mounted upon two wheels at the front and a skid at the rear It is 33 feet long and the planes have a great of 30 feet and 310 equates feet of emporting surface. They are set at an angle of free feet. They are set at an angle of free feet. The feet of particular places are at feet by 2 feet. I feet 1 feet have a spread of 20 feet and 320 square feet of sup

laines

Mr Roe has done most of his experimenting at

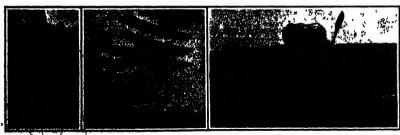

Nombley Park and recently the grounds have been
suitarged there so as to give him more room. He
see made a considerable number of short flights in a straight line and his machine is remarkable low power light weight and small spread

AVIATORS COSTURES AND A MACRIES FOR TRACKING RESISTERS.

Two of the photographs reproduced on this page give a very good idea of the costumes worn by French aviators and of the dress soon to be adopted in France by the lady operators or aviatresses. The costumes used by the men consist of overalls and jumper and a tight fitting skull (a) empiritely covering the head.

The contume being used by the lady operators consists of a loose blouse and long bloomers extending to The contume being used by the lady container and select of a loose bloose and loop bloomers cardening to the tops of the shoes. A skull cap similar to that used by the men is also worn. At the present time but two fadles have made slights by themselves in servolpiance in Prance These are the Rarchesse do is Roche who operator a Voisin bipliance and who recently met this as a richet by running into a tree and bitle Marriagt who is the first woman in the world to have the service of grice (al

getes (al Another interesting licture at the bottom of this lage shows a novel training machine for accustoming aviators to a monoplane of the Santos Dumont type This machine consists of a substantial iriangular body mounted upon three wheels and terminating in a tail mounted upon three wheels and terminating in a tail having movable vertical and horizontal surfaces by whith the machine is sieved to right and loft whan running along on the ground or by which the tail is made to rise a short distance in the air. The two made to rise a short distance in the air. The two bottom monther of the trinquisite frume are extended forward and met above a small wheel five or air feet ahead of the main wheels so that if the makine this forward when the tail rises the front whole keeps it from til jing too far A fearty-finder water-cooled motor of 40 horse-power is mounted upon a U shaped frame and carries - proposite in front on its trank shaft. The would water sit in a small near he-had. The machine is fitted with large wire wheels fitted with large diameter; pounts to tires. With this machine a beginner can inval at very fixed speed over utou with arge stameter pounds of tree. With this machine a beginner can travel at very fast speed over the ground and accustom bimself to the steering aide ways and up and down of a monoplane. The machine should serve a unserin purpose in training aviators who intend to fly this type of a roplane.

JOHN M BIRMON

SHORTING A RIPLE.

To the Editor of the Scientisto Ameri

To the Milion of the SCENTYION AMERICAN.
Therey mackmoan is familiar with the effect of raising or lowering the rear eight on his rifle. Perhaps on to commonly understood is the effect of raising or lowering both frest and rear eights simultaneously on point-blank range the target front and rear correctly pointed. The trajectory of the builet is correctly pointed. The trajectory of the builet is a corre intersecting this straight line in two points one of which is the conter of the target. It therefore follows that if a rifle is correctly sighted for correctly necessary of the content of the content

The most accurate shooting is done with 0 32-milber rides at ranges of from 15 to 50 yards and when once the sights are correctly set for one range no marks man likes to change them. It may therefore be of interest to know how they may be set for correct work at two ranges which may be a considerable distance

The path of a projectile in vecuo is a parab The path of a projectile is escue in a parabola and alone air resistance may be neglected for very short ranges and low velocities the parabola equation will be correct enough for our purposes. The equation is usually stated thus

y at me distance from the line of sights to the center of the gun barrel x the range y the acceleration of gravitation and x the angle between the line of sights and the center line of the gun barrel. The x lation of those quantities is all shown in exaggerated detail in the diagram u is the distance from the line of sights to the center

Since the angle s will lequite small for short ranges we may replace cos s with unity which is I ractically its equivalent thus simplifying the equation. This

Taking data from a Winchestor 0.22 rife equipped with globe sights and sighted for 70 feet we have y = 9/16 inch == 0.0468 feet v == 1.000 foct per se

Reducing to the form -+--#+--== 0 in whi h the 6

product of the roots equals the third term we have

$$m^{2} - \left(\frac{1100^{2}}{16 \ 1} \tan \alpha\right) x + \frac{1001^{2}}{16 \ 1} 0 \ 0489 = 0 \qquad (4.5)$$

Calling the roots o and z. o c. - 0 0468 14 1 1 000

Thus when one range is 75 feet the other is 39 feet update is too close to be of any use. We see also that the 75-foot range is on the failing side of the curve so that a Mittle greater distance will land the belief below the mark

To bring c, on the further side of s, it is avidently necessary that y must be increased or in other words both the front and rear sights of the rifle must be ele-

We will now find the value of y so that the gun will shoot correctly at both 7" and 150 feet. As before

$$a^a - \left(\frac{1000^a}{16 \cdot 1} \tan a\right) a + \frac{1000^a}{16 \cdot 1} y = 0$$
 (8)
Taking the product of the roots equal to the third

term 75 180 =
$$\frac{1000^{\circ}}{161}$$
 y y = 0 151 feet = 3 17 inches

Thus by setting the front sight 3.17 inches above the course of the hore and elevating the war sight till the gas aboots correctly at 18 fort it will be found Apic clerked, at 156 fact. Moreover R may be shown tight in page to the fact of the sight of the sight of the sight page time Ad inches. The angle of elevation of the by 1 recapit

sights may also be determined from the equation but it is much easier to get this angle right by means of trial shots, as it is very small and difficult to mean-ure. The determination is as follows in equation (3) the sum of the roots equals the coefficient of s with its

tan em 0 00000 a = 11 min. If sec Of course all the above recuting are based on the sammplion that the valocity is 1000 feet per second which is about correct for a 5 above taxtridge. Be-wards of the control of the control of the control Air resistants which causes the projectile to depart from a parabolic path will have the general effect of causing the tabular values of y to be too low but this effect is not very noticeable for the short range and the valocities with a recommon in 0.21 calibre marks

manably

The results are not intended to as ply to high power
rifes and long ranges although the departure of the
projectile from a parabolic path does not alter the
fact that any rife may be correctly sighted for any
two ranges within its limit

The Light of the Firedy

The Light of the Firedy
After r fering to the original work of Prots Lang
ey and Borry and describing accurately their methods
of investigation Dr H B Ives and W W (oblants
draw from tielr wn investigations the following very Interesting untitud u as to the relative officiencies of the light of the firefly and that of incandescent electrk lamus

m ien y of the light of the carbon flament The filen y of the light of the carbon filament lamp is 043 per cent in other words of all the energy of a med only 047 per c at is converted int light The lampshe lamp has an effi n y of 13 per cent and the mercity at 38 per cent. The effection of it is light of the first is 16 per and Making the comparison in another form the arbon filament lamp comparison in another form the arbon filament lamp has an eff long of 83 watts per mean homispherical condic, the tungsier lan | 16 per candle and the metallic are 0 watt per candle. In comparison with thes 1h Briefly has an efficiency of 0.02 watts per candle

The most significant trophy of modern times. Warmed by the midnight sun and drenched in Warmed by the midnight sun and dreached in the fogs and snows of the Arctic, it has waved at the apex of the earth, where a day and a night are a year, and every direction is south. No battle flag was ever planted in the enemy's stronghold after struggles as severe as those which carried this banner to the goal. It is the Star Spangled symbol of courage and endurance and faith beyond comparison. It is the emblem of man's conquest over every obstacle, the triumph of spirit over matter

We have taken this priceless trophy, symbolical of all that is strongest and most enduring in American character, and have reproduced it in fac-amile in colors on the cover of the February number of Hampton's Magazine Every man, woman and child in America should preserve this reproduction among their most treasured possessions. The magazine can be bought, but

possessions I ne magazine can be bought, but the flag cannot—like all priceless things, it can only be given away Read Peary's Own Story. Now appearing exclusively in Hampton's Magazine Every instalment is complete in itself. In the February number Peary tells about selecting the

their life and their strange customs, what they have meant to him, and what he has meant to them No one can understand what it means to discover the North Pole, unless he knows about these strange people who helped Peary to find it

Whoever takes pride in being well-read and well-posted in regard to the world's progress, should read this story of the greatest discovery since that of Columbus No other magazine feature has ever aroused such widespread interest among thinking people

You Buy Ability, Not West Material, When You Purchase Our Coal

Coal only starts at the furnace. The steam it produces runs vour factory, mill. electric plant. The better the coal the cheaper the steam.

Pardee is an economical coal. It's uniform. Uniformly good. It has high steaming ability. It is exceptionally high grade bituminous coal. It all comes from one basin -in Cambria County, Pa. That's why it is always the same.

Pardee is carefully inspected and prepared before shipping, which guarantees clean, efficient, steam-producing coal. This is boiler-room economy.

PARDEE

Ash in Pardee is at the minimum. Another point of economy.

On its merit alone Pardee is used by conservative manufacturers throughout the country.

Whether you have a large or small plant, it will pay you to look into this. Our mechanical engineer is at your disposal-without charge. Particulars supplied inquirers concerning

WAVE VERSOS SHIP

A8 it e isst desputring protest of Old
Occan, when he lifted his gluut hend in
the blackness of the night of Jamery 10,
and smore the Lustiania' a how which
racked and splintered her lofty bridge and pilot house, 75 feet ubove the sea und crushed down her forecastle deck and decks beneath, giving them a permunent dapression of several inches? For time was, and not very long ago, when the me was the undisp no very long and, went the we was the undisjuted master of the shijt, and when ver Neptune saw it to open the visits of his wrath and send his langue-long rollers across the deep the proudest ship of the day must needs sing at his hidding if she did not luderd turn and run before the tury of the blast Of leto years, man, by virtue of his knowledge and mechanical skill, has been huilding in ever increasing lengths and breadths, and with such caseless en largements of bunker and boller room—he has so multiplied horse-power, and hus called to his sid so ingenious contrivuoces for speed and strugth and safety, that uid Neptune must for many a decade past here for seen the humilisting day when he could no longer hold the destinies of the bold sea voyager

no longer must and no longer say to him. Thus far, and thus slowly shalt thou go.

Following the litht of ultimate victory which was supplied by the "Lustianie" and "Campaulu," cam-that wonderful ship of the Hamburg American Line the "Deutschland," and the even larger and more powerful 'Kalser Wilbelm" and "Cecilie' of the powerful 'Kaiser Wilhelm' and 'Cecillic' of the North German Lloyd, and with the advent of each giant vessel, man a growing mastery of the ocean was above in ever forevasting speed, and a closer approxi-mation in times of departure and arrival to the requi-lative of transportation on isoda It was reserved for the steam turbino to supply the last mechanical device which was to give to tune

his age-long struggio with the elements a weapo in his age-tong attention to the combinetion of size of complete victory, for in the combinetion of size and sirength end power afforded by the latest turbine liners there has been developed a ship which has demonstrated its ability to drive at full speed and all day long into the heaviest seas that the stormy North Atlantic could pile across her path The writer will not soon forget a notable day some two winter will not soon forget a notable day some two winters ago, when the 'Lusitanie, in weather which varied from a gale to a full hurricane, averaged for twenty four hours a spred of between twenty-six end twenty four hours a speed of between twenty-six end teenty-se we land mitte an hour During the tunuit of that tremendoms struggle tenton enchors were shifted, it is true and steel derrik boors were saving attinuariship and twisted as if they were no stouter than a boys tim whistle. Yet the ship steamed into port practically intact and wi and with not e rivet

Ordinarily a transatisatic liner will drive her wey against a westerly gate vayage after voyage, with no e serious hart than the bending of a stan the breaking of a pane of glass in the idlot house But one in n long while there may come a combination of sens with here so related to the length o the ship that she may be riding down one were, her box burted deep and hor forecastle deck awash just as her seem drives hate a roller, steep of front and of west hight. Then it is that the structure of the ship macts its moment of supreme trial and not even the officers 75 feet above water, ore safe from the full impact of a solid Atlantic

sen. On the Monday night in question, because of the tempestuous westiter, the glass windows in the pilot includes the lowered and the storm windows built of solid wood with a small heavy glass port light in the center, tend been raused. The stern of the, ves-sel was lifting high on a recoding sea, and the fore-

castle deck was awash, just at the moment that a wave of gigantic proportions icomed up at the bow. From the fact that the solid water swept entirely From the fact that the solid water swept entiresty over the pitch house end the compass stand upon its roof, which latter is at least 80 feet above tha nor nel weterline, this wav must heve been some 35 feet high measured from the trough. The semwas breaking and therefore the mass of water must have had considerable forward momentum. The ship have and considerable toward momentum. The any itself was running at helf speed, end met the sea at a speed of from twelve to thirteen knots. When the mass struck the breastworks and pilot house, every mass struck the breastworks and pilot house, every one of the stont wooden storm windows was burst in, the woodwork being stripped clean to the sashes, end the stout steel framing between the windows was forced several inches into the pilot house. The sea ward, driving a piece of the woodwork be through a herdwood casing containing a portion of the firefighting esparatus. The quartermaster was borna back egainst the bulkhead behind, carrying in his hands the wheel which was torn from its stands. The mass of water then swept into the officers' we room and staterooms, filing them breast high with water—and this, be it remembered, at an elevation of 75 feet above the normal sea level

Now, since the entp is some 80 feet broad et this point, and the distance from the pilot house to the stem must be et least 150 feet, and since, in order to roll over the pilot house, the waves must have been some 35 feet in height, at least 4,000 tons of water must have swept over the forecastle deck—as enyor with a pen if and pad mey easily figure out for him self It cannot be possible that the wave fell with much vertical impect, or the decks would have crum piled up like an eggshell, but the momentum was sufficient in crush the forecestie deck and the three decks below a few inches down into the body of the ship, leaving them with a pornument set Drametic evidence of the enormous stresses to which the ship was subjected is efforded by the stanchions and solid steel bulkhouds below the deck, which, in some places, buckled out of the vertical as they yielded h meath the load above. Had the 'ludtania' not been built of special strength to stand such buffeting as this, the results night easily have been very serious indeed. the results night easily have been very serious indeed, and we ure infined to agree with her cagtefu in his belief that many smaller and less atomity built ships, which have disspecared utterly at see, may have been sent to the bottom by the crushing in of their decks under so-cailed tidal waves"

INDUSTRIAL PELLOWSHIPS IN UNIVERSITY WORK.

HE University of Kanses has inaugurated a system of industrial Fellowships, system of Thomas run removation, when a based upon a broadly similar practice that iss siready ben followed to some extent in Europe Some three years ago Prof Duncan of the Department of Industriel Chemistry directed the of-Department of Industrial Chemistry directed the situation of manufecturers to the necessity for greater technical efficiency, and suggested that this might be promoted if the manufaturing interests in the field of industrial chemistry compersated with the university of the contract of lished

A Fellowship for an investigation into the of laundering, with a view to saving laundered febrics, \$500 a year with 10 per cent of the profits. An investigation into the Chemistry of Baking estab-

lished by the Netionel Master Bakars' Asso with the object not only of improving the chemistry of bread but of providing for the association of a trained expert on whom they could thereafter rely, \$500 a year together with a sum to be settled by arbi-

An investigation into the relation betw properties of glass and its chemical constitution, \$1,500 a year end 10 per cent of the profits.

The discovery of new utilities for osono, \$2,000 a year and 10 per cent of the profits.

year size to be recent of the promise.

The general form of the agreement calls for an investigation to which the holder of the fellowship gives his whole time and attention, with the exception of three hours a week which he devotes to work of its struction in the Chomical Department of the University The Police, who is appointed by the chancellor and other officers of the university, must have a reputation other officers of the university, must have a reputation to research, must be a member of the university, must work under the direction and advise of the Professor of industrial Counsistry, and must forward through him to the industrial company, the decare of the his closely, periodical reports of the progress of the law of the processor of the his work. All discoveries made by the fellow during the tenury of the following the tenury of the following the tenury of the influstrial company, subject to the payment to the fellow of it per cent of the set profits. In the event of any discoveries made to the set of agreement between the donors and the holder, the chance lor of the university, or his appointee, is mu-

tually accepted as arbiter
The advantages accruing from these fellowships cording to Prof Duncan, are that the university gains increased opportunities for promoting research, that it obtains three hours a week of gratuitous and skilled instruction, that the manufacturer obtains the ad-vantages of vastly increased laboratory facilities and vantages of varity increased laboratory facilities and full library facilities (for lack of which factory re-search has been most seriously hampered in the past) that the manufacturer has consultative advantages, almoe the fellow appointed is et liberty to question specialists in the different fields of chemistry, that the specialists in the different news of elementy, that the manufacturer is freed from supervision of the work of research, and that on the termination of the fellowship s, if he se desires, the services of a man cated to this particular need. As researds the fellow, he co-operates in the advantages above ascribed to the manufacturer, he obtains an inside knowledge of facmanumeturer, he obtains an inside knowledge of fac-tory processes, end he is freed from the petty Inter-ferences and jealoustee of also employees and the "pot-shop" judgments of factory officials. Moreover, if he makes good, he obtains a pottion for which hei train-ing during the fellowahlp renders him peculiarly qual-tion.

Finally, since at the end of the three years' term ell work done under any fellowahip must be published free to the public, the latter becomes one of the most important beneficiaries of the new system. The insertion of this last (leuse was at first resisted by some itum or time sast (souse was at irst resisted by some of the menufecturers, but in the end the donor, when it was pointed out to him that a realty progressive magnifacturer would find that three years would give him a sufficient start of competitors, withdraw his objections

THE MOON AND RADIO-ACTIVITY

THE HOUSE AND RABINGAUETATE.

IE probable influence of the moon's movement upon the radio-activity of the air is brought out by M Paul Besson in a paper presented to the Académie des Sciences presented to the Auddmide des Sciences
We find that inferent authors show great varietions
in the radio-activity of the air and M. Bession
concludes that this radio-activity causes from the
ground, as Elster and delict also suppose. He medic
apprehensis in the summer of 1908 and 1909 and
aboved that the variation in the activity of inferral
the authority presents being. weter veried with the etmospheric pressure, being highest when the pressure inwered. Other authors ob-served the same fact. When the barometer descends served the same fact. When the barometer descends the emanation from the soil increases, and the contrary. But he noticed other variations which were ounted for, and thought that they might co unaccounted for, and thought that they might come from the tidd in movement of the earths crust, which was slown in a striking way by M Charles Lallemand of the Bursen of Longitudes When the moon passes the meridian it cause a tide! wave in the sarths crust, and the emanation from the soil is maximum at this moment, and vice verse, at least as may be empoosed. The anthor's observations feed to the foliowing conclusions. As regards etmospheric pressure-aione for a one-hour test which is constant with relaalone for a one-hour test which is constant with rela-tion to the moon's passage at the meridian and thus satisfied the moon's influence, the radio-activity in-creases when the atmospheric pressure decreases, as that et a constant barrometric pressure, the activity as that et a constant barrometric pressure, the activity and mustimum for the passage of the moon at the meridian and minimum for the passage at the other side. The author hopes to make a more complete series of ob-servations in order to establish his hypothesis. If the law of variation of the amenation coming from the earth could be established, we would ascertain the principal cause of the variation of the air's radio-activity Should it be found that the moon's movement cansed changes in the radio-activity of the air, we cannot changes in the ratioscrity of the air, we would here the proof that the moon has en infinence on the changes of weather, according to the popular belief, this being caused by multiplying or lessening the centers of condensation of water vapor, outside of air pressure offsets and others.

air pressure offects and others.

Mr T H Swelberg has succeeded in obtaining by ultra-richet radiations, collidate solutions of various results in different illegalet, The metal to be pulverised should be perfectly freed or any surface acid-fine basis covered with the solution in a fint bown, it is exposed from above to the redistance of human to the contract of t metals and solutions show a rather different behaping. Thus allver, copper, its and lead were found for he quite readily polyected colloidal existinae, whereas pictures, grantistens, and canfirms show only a very slight, if any, pulverisation. A NEW ERA OF THE AMERICAN LOCOMOTIVE

TWO REMARKABLE ENGINES

It is not stretching the point too far to say that the design of the locomotives herewith illustrated, one for passenger and the other for freight service, marks a new era in the development of the American steam locomotive. This is particularly true of the passen

This has been done in both engines by utilizing the great length of boiler space afforded by the articulated system of construction. As will be seen from our sectional view, the boiler proper terminates above the high-pressure cylinders. The shell, however, is ex

the high-pressure to the low-pressure cylinders, the heat so taken up by the steam serving in each case to raise the heat energy of the latter Finally the gases pass through a large nest of tubes, around which the feed water is caused to circulate and is raised to the

A NEW REA OF THE AMERICAN LACOROTIVE.

PUTTING OLD NEPTUNE TO WORK

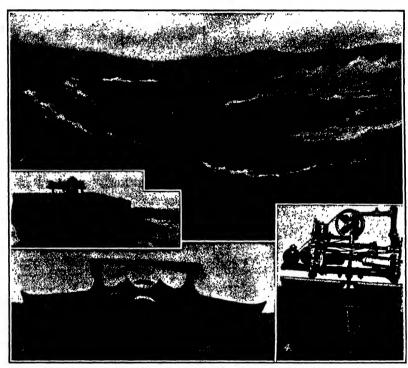

Twice each day millions of tons of shipping in New York Harbor are litted to a beight of over four feet and dropped the same distance by the title This same work is done in every port to a greater or leas degree. Many a man has eaviously considered this normous acceptaliture of power and racked his brains cnormous expanditure of power and racked his brains for a means of putting it to valuable service. How ever, the work done by the tides is enormous only be-cause of its vast extent and herein lies the delusion which many an inventor has failed to discover until which many an inventor has failed to discover until the has devoted much thought and time on evolving a tide motor. The work done in raising of the "Lusi tania," for instance, which weighs 40,000 tons, repre-sents an expenditure of energy of only sixteen horse-sents an expenditure of energy of only sixteen horse-

is utilised to operate a series of pistons pumping air into a compressed air tank. The compressed air tank and four pairs of criinders are mounted on the main and four pairs of orlinders are mounted on the main fact. The plate not are consocied at their outer ends to the four fosts and when these fosts are rocked by the waves they serve to reciprocate the pisions and pump the air. This action takes place regardless of the direction is which the waves are travelling because the savillitary floats extend in four directions. As entirely different method to utilising the force of the waves is shown in Fig. This commission of a large or places are the savillary floats extends to the con-

that the waves will wash up over the floor of the crih as they do on an ocean beach. At the back of the crib

rock to and fro the pinion is rotated first in one direction and then the other, and this motion serves to map all rise a task. The air from the tank operation a pneumatic motor which in turn drives a dynamo and generate electricity in order to peralt the finist to sating about it any direction without dange of fooling the anchor limite one of the fiduct is mounted on a awivel which is securely anchored. By means of con-tact wheels engaging contact rings on the swivel the electricity generated is conveyed to a pair of cables

electricity generated is conveyed to a pair of cables within extend to the shore. The construction shown in Fig. 4 depends for its operation on an entirely different principle. It is well known that the wave disturbance of the ocean does

Four movel methods of utilizing the power of the waves,

PUTTING OLD MEPTURE TO WORK

power, this being due to the fact that the tide acts very slowly, taking six hours to raise the vessel to a height of four feet.

However, there is another form of energy displayed by the oeas which is for more powerful than they the oeas which is for more powerful than they the oeas which is for more powerful than they for explaining a portion of this belt, and here there appears to be more opportunity for containing a portion of this power and device they developed its by most powerful than the second that the content they develop entirely to much energy and are said to wreck his machine. The accompanying engineering the limit of the content of the co However, there is another form of energy displayed

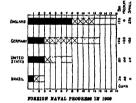

are a pair of curved deflecting walls before which is are a pair of curved defecting walls before which is a placed a triangular casting provided with a series of swinging doors or vanes. When the wave wash up-the floor of the erfb hey does the wanes against the easing and divided by the prove of the casting are di-rected against the defecting walls. The rear of the triangular casting is opered, permitting the water to five through as the wave receive and strike against the war faces of the wares opening them to the posi-tion shown in the litheration. The wanes are servertion shown in the illustration. The ranse are geared to a series of pictum rods which owerstic the rylinders to fill in compressed air chamber. The latter, by mean of a pair of air motion operations a dynamo and generates electricity which may be conveyed to any desired spot and utilized. Fig. 2 shows a construction similar to Fig. 1, making see of the recting of two floats. The floats are hinged to such other and one curries ruch adapted to estimate a phasics misconicé on the other float. As the floats

not extend to any great depth and it is the relative moto carear to any great sepan and it is the restrict motion of the surface water with respect to the water at a considerable depth that is unde use of in this case to generate power. A final te provided from the center of which projects a shaft fitted at its lower end with a set of radial flux. When the float is rocked by the waves the shaft tends to remain vertical owing to these fins Mounted on the float are a series of cylin ders provided with the usual pistons which are con ders provided with the usual pistons which are con-nected to an extension of the vertical shaft just re-ferred to, and while the pistons remain virtually fixed the cylinders are recliprocated upon them by the rock-ing of the float. The pistons serve to trivilate oil through a rotary engine which in turn drives a dyon me and thus generates electricity. When the wave When the wave motion becomes too violent an electrically-operated by passing through the motor and thus an excessive speed

PORRIGH WAVAL PROGRESS IN 1908. ------

During the year just closed considerable navai activprincipal dayal powers adopted large programmes of new construction and made good progress with those already in zaletane, but the niluor powers have shown in a practical manner has a "" rought fever has taken on the mind of the world

Great Britain during 1909 has finished the last of the trio of battleship-ruleers of the Invincible AMERICAN are already fully aware through the appear ance of the 'infaxible' at the liudson Fullon relebra The three battleships of the 1906-7 programme ficilerophon,' Temeraire' and "Superh"-the like rephon.' Teneratics' and "Buperh"—
have all been passed into service. They are of 18,000
tons, 700 more than the "Dreadnought," but differ in having sixteen 4 inch 31 pounders for their antitorpede armament as compared with twenty-four 12 pounders The end of the year saw also the completion of the battleship Vanguard, of the 1907-8 pro-gramme which was turned out by Vickers, Sons & remnine which was turned out by remain, bowed the Maxim in the record time for any ship since the Treastrought herself, of 19 months. The "St Vin Urraduougnt bersett, or 19 months for 3 viii cent and Collingwood compileting the 1907 8 trio, will be commissioned this spring. All are of 19,250 tons, and have ten 12 inch 50-caliber guns (the main armament of the others is 45 calibers; and twenty 4 inch rapid fire weapons. The thickness of the main by it is reduced to 9% inches in these ships compared with it inches in the earlier vessels, but a larger area of the hull is protected by thick armor. Other area or the null is protected by thick armor Other vessels passed into service during the year include the unsumored trulser 'Hundleck,' or 2300 tons and 25 knots, designed to act as mother ship' to the destroyer follilas, a number of 33 knot destroyers khots, designed to are as motter supp to use de-stroyer folliths, a number of 33 knot destroyers-"Afridi" (which had to ix accepted at 1276 knots) "C'rusadar," "Amsson" Saracen," "Maori, "Yiking," and 'Zulir A new lyie of submarito has been com-pleted. This is the 13" of 600 tons, which showed

ed submerged. She is fitted with twin

scrows, and has a steaming radius of 4,000 miles.

The vessels launched during the year are the bat tieship "Neptune," of 20 250 ions, with the same arms ment as the earlier Dreadnoughts, but so arranged that there is a broadside of the whole ten beary guas, and the structured cruters "Indeatingship," 19,000 tons, carrying the same battery as the "Invincibus," but longer, enabling a wider are on atther beam to be covered by the whole olghi 12 inch guas A number of small crutsers and destroyers have also been tours hed

Three new battleships have been commenced. They are the "Hercules," "Volossus," and "Orion," of the same displacement as the "Neptane," had with the fire 12 linch gus lurrets arranged arisally. The syncord cruiser Lion, also laid down will be of 25,000 tons and 3% to 29 knots, and will carry ten 15 linch guas

Germany has had a record year in naval construc-tion 8he has completed her first two Dreadnoughts, the "Nassau" and "Westfalen," of 18,500 tona and armed with twelve 11 inch and twelve 59-luch guns Both ships exceeded 20 5 knots on trial, although de-Both ships exceeded 20 6 knots on trial, attnough de-signed for 195. The armored cruiser "Blucker" has been commissioned as flagship of the High Sea Floots cruiser squadron. This vessel cannot rank with the liritish 'invincibles, but as is nevertheless a powerful ship, displacing 15,500 tons and steaming 245 knots on Irial Her armament consists of twelve 8.2 inch and eight 59 inch guns, and her main belt is 8 inches thick The battleship "Rheinland," sister to inches thick. The battlesnip "musicum, the "Nassau" is now running her trials, and the "Po-

em will follow this apring

Five large battlesbips have taken the water during the year Three of these are battleships—the "Ost friesland" "Thuringen," and "Helzoland," each of friesland." Thuringen," and "Helgoland," each of 20,000 tons. They are the first German ships to be armed with 12 inch guns. Krupp's having built a 50-caliber weapon firing a 981 pound abell. Twelve of these guns will be carried as well as a similar num-ber of 6.7 inch—In armament at least, therefore, these ships will be greatly auperior to any British ship yet launched. The armored cruiser "Von der Tann" has also been launched. She is of 18,760 tons and will steam 25 knots, her armament comprising ten 114nch and a secondary battery, it is believed, of 59-inch guns. The cruiser "Q," following toward the close of the year, is a sister ship

the year, is a sister ship
Two small proisers, the "Kotherg" and "Mains," have
been completed. They are of 3,800 tons, earry fourtien 4 linch guns, and sistemed 27 to 28 khots on
tris! The completion of destroyers continues a factor of naval strongth in which Gormany loads the
world Her twice vessels of the 1908 programme are

world Her twelve vessels of the 1905 programms are in commission at a time when those of the British programme for the same year are only being launched Three battleships have been said down, similar to the "Helpoland," but equipped with turbines. They are the "Ersats Frithjof," "Ersats Hildebrand," and are the "Ereats Frithjof," "Ereats Hildsbrand," and 'Ereats Heimdali" The armored cruiser "H," of the 1809 programme, was laid down in December, 1808, in advance of the orthodox date. Two more small cruisers, twoive destroyers and some submarines have n laid down

auso neen haid down All the French battleships of the "Danton" class have now been launched They are of 18,400 tons and will carry four 13-inch and twelvo 94-inch guns. Adwill carry four 13-lnch and twelve 94-lnch guna. Admiral Bous of LaPeyrore, the new Minister of Marine, has done much for the benefit of the naval service. The next ahips to be ladd down, two of which will be started at once, will be of 23,400 tens and will carry twelve 12-inch and eighteen 55-inch guns.

A start has been made in the re-creation of the Rus sian navy, and four natitudings were laid down at the Raility pards on Jene 14th hat, where they will be built under the supervision of the British firm of John Foren & Co. Their names are "Gangut," "Revision of the British firm of John Brown & Co. Their names are "Gangut," "Revision of the British and attom 47. The designed useed is 33 moia. The two Riske See subtiships "Ander Percursarial" and "Importate Pavol I" have been completed, as well as the small armorder cruster "Fallingh," 5,500 mos. The former are 17,500-ton vessels, carpying four 19-int the first has deventy when the state of the supervision of the s dan navy, and four battleships were laid down at the

armed with tweive 12-inch, ten 6-inch and tweive 47 inch guns The "Batsuma," iaid down in 1905, has been passed into service Displacing 19,250 tons, she carries four 12 luch, twelve 10-luch and twelve 6-inch guns Much difficulty is found in turning out ord nance fast enough to supply new ships, and the arm ored cruisers "lbuki" and "Kurama," laid down in 1905, are still delayed by this cause Two new cruis-ers, the 'Huki' and "B" have been laid down. On 18,650 tons they will carry six 12 inch and fourte 6-inch guns, and steam 25 knots

6-linch guns, and atsam 25 knots Among the lesser powers ltaly has isld down four large ships. The "Dante Alighier! and 'Cavour' isles "Leonaried at Vincit" will carry tewler 12 inch, and the "Michael Angelo" and "Galliec-Gallish," it is reported, eight 4 linch Austria has leuvehul to her half believed to the her half with the half which has been overeal as soon as financial difficulties have been overeal as soon as financial difficulties have been overeal as soon as financial difficulties have been over come The first of the three Spanish ships, the "Es pana." has been communed, and will carry eight 12pana," has been commenced, and will carry sight 13-inch gues on such a low displacement as 14,760 tons. The Brustlian "Minns Gerace," with twaive 12-inch has been completed, the "Sao Paolo" is nearly ready for trials, and the "Rio de Janeiro" has recently been tor trian, and the "Rio de Janeiro has recently seen laid down The Argentine is going to have two battieships bniit, and Chile one A Chinese navai commission is touring Europe with the ultimate object of placing orders for three 15,000-ton ships; Turkey has sent Admiral Gamble back to England with in nesses Aumira dambie back to England with in structions as to the ordering of two battleships, and Greece has allotted five million dollars for the pur-chase of an armored ship from an Italian firm.

HOW AN AMATRUR MAY FIND HALLEY'S COMMIT.

BY MRY AUG. W RORMYS.

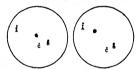

Thinking it a laudable ambition to be the first amateur to find Halley's comet, I have been working with teur to find Halley's conset. I have been working with my 34-jinch tekeopo for several weeks trying to locate it. I have not tearned as yet that I am the first, but being confident that I have succeeded in finding it. I have thought that other annatours suight little to know how it might be done filese the easy method here described may also be employed by handstern in other stupies storline of the beyond, I have gone somewhat mits details. Despite the fact that ones extraordinate of the control journals have said that it would be some time before the comet in question could be seen in a small telescope. I have the word of a prominent astronomer that it can now be seen in even a 5-inch-provided, of course, one knows where to direct his

So the first problem is to sacertain the position of he comet. There are very few amateurs who have alsecopes mounted with circles. Hence we must

adopt a plan that will enable us to find it with-out such aids. Of course it would he air easy task be locate it if one hast all the equipment of an observa-tory, mersly by setting the telescope in the proper right accounter and declination.

Now it we will turn to the recent files of the Semi-rope of Assession, we may find the right assession and declination given for every other day during January and Pelveary. The data for the intermediate days and be easily deduced by making last the difference of any two alternatic days and adding it to the residing to the substantial of the second of the contraction of the property of the second of the second of the con-traction of the second of the second of the second attacks should be one of the first books owned by an anasteur Almost any good library can furnish you with such an atlast if one is not already at hand. Then with the ophemeric before you follow the course of the somet from day to day by tracing the right se-cansion and decilization on the map. Note the day when the recidings first come near to some prominent star This will be the time to put the methed to trill be in order to have acately how mere the conset will be w if we will turn to the recent files of the figure star I fins will see that time to put the method to trial. In order to know startly how near the comet will be to the star, consult the Nantical Almanae or any other source accessible to find the R. A. and Dec. of the star Upton or other star atlesses will give the data for

ome of the stars.
By this process I found that on the even By this process I found that on the eventing of No-vember 30th the cornet was to be near Adelebrata in Taurus, so I began in good season to make my trial The evening before I made four carefully constructed charts of the stars visible in my field of view I is used my 4-f-power expelse, and this meant about to minutes or 47 minutes of are, in the field. Upton on page 14 gives the R A of Adelebratan as 4 to 10 min, and the Duc as + 16 degrees 19 min. The R. A. of the content on this day was 4 ter 30 min, and the Dec, + 15 degrees 56 min. The R A is the same, and the Dec place II to the south of Adelebrata The would bring it within the field of view of the telescope. One can estimate quite accurately the number of minutes of arc within the field of view of the teles sighting it upon some object whose size is known. To moon is suitable for the smaller powers it is

6 P. M central standard 11 P. M. central standard time. Jan. 14th, 1910 time Jan. 14th, 1910.

A is a small double star, B is a star of the 8th magnitude; C is a very dim star the collection of dots is Halley's count.

min of arc in diameter Epsilon Lyrses may be used for the higher powers. The two principal stars of this for the higher powers. The two principal stars of this double (in reality a quadruple star) are 3 min apart. My 300-power presents a field of vision of about 6 or 7 min. Now if the point axis of the tolescope is pointed exactly to Polaris, it would be necessary only to make one map of the desired area and estimate the 28 min distance to the south I had my theseope, on this particular seroina, directed from a story window and was not sure of my exact second-nory window and was not sure of my exact polar location, so I drew the four maps, hoying to be more certain of incinding the comet within the list. In making such observations and trying for a definite location north or south, saft or west, one must hear in mind the fact that an astronomical telescope inverts the object. A little study with the moon, which can the conject. A little study with the moon, which can also be observed with the naked eya, will help to straighten out this matter. Now after making these four maps on the evening of the 29th, I planned to rour maps on the evening or the 29th, I planned to observe carefully the next evening to see if I had any object in view not viewed the night before. But the evening of the 39th was dimly illuminated by the comweening of the start was clearly illuminated by the com-ing rising of the moon, while the second eventus was much darker, and I found many new stars in view While i had thus planned to locate the count by a process of addition (and this while have been the process of addition (and this whole have been the more destrible as it would have apachted a more car-more destrible as it would have apachted a more car-ful scrutinty) I decided to look for it the next questing by a process of estimatation is on the svensing of the side of the contraction of the contraction of the same areas like those shown in the engraving and made about two weaks ago. Something like withy or ex-city stars appear in the corts. After prevent evening one star on the suppe failed to appear gants, I find-cated this position by a small erice. So I concluded that this was the comet. I have since worling it by a statch translation as by a premianted astronogenes deli-stration of the contraction of the contraction of the contraction of the position of (Dhisteases on pages 125.)

THE LAST WASHINGTON CAPAL.

A public work of much importance, though not wishly known, is the proposed canal connecting the tidal waters of Puget Sound with the fresh water lakes, Union and Washington, Jving in or adjacent to the city of Senttle, Wash. The project is a very old one, though it has yet progressed to further than the acquirement of right-of-way, the formal adoption of a project by the War Department and its submission to Congress, and certain local messures now in progress for the raising of funds to sid the government in the

e canal is to be a joint enterprise, to the The canal is to be a joint enterprise, to the cost of which the government and the local commonity will stimately contribute about equal shares. The local community has already acquired and delivered to the United States the right-of-way, costing about \$250,000 in will assays the channel at a cost of about \$1,000.000 The railroads, street are companies and city will have to construct bridges and cost of about \$1,000.000 The railroads, street are companies and city will have to construct bridges and cost of about \$1,000.000 The government will be shall be constructed to the construction of the constr build the lock and controlling works and a power plant. It will also hulld the entrance works and take

pant. It will also build the entrance works and take care of certain other features of the project and will maintain and operate free of toil the completed work. The cost to the government will be about \$2,000,000 Pollowing are some of the benefits of this work which justify its construction and which also justify a division of the burden between the government and the local computity. It will be of great value to the navy by giving a

admirable fresh water waiting basin for vessels laid up in ordinary time of peace Puget Sound will al ways be an important naval rendesvous, and the Navy Yard is only 18 miles from the canal entrance.

It will give a much needed expansion to the harbon It will give a much needed expansion to the harbor facilities of Elliot Bay The practically available frontage on the Bay does not exceed 5 miles, and a large part of this is in the hands of the railroads. The opening of the lakes will give fully ten tin The opening of the lakes will give ruly ten times greater frontage than at present, and much of it better situated for public convenience. It will make accessible extensive sites suitable for manufacturing cetablishments. The areas at present available, where both rail and shipping facilities can be had, are extremely

The completion of the canal will give much The completion of the canal will give muon second anchorage grounds for shipping Many vossels are laid np during the winter, and owing to the excessive depth of water in Puget Sound, suitable anchorages are very scarce Not only will the lakes afford better prage grounds, but they are free from the destrucanohorage grounds, but they are free from the destruc-tive effects of marine life which is very active to the waters of the sound. The halls of vessels will entire much less destroyation than it and twater. Likewise subagnosus timber construction, which cannot be de-pended upon for more than a year in the sound va-less the timber is "treated," is practically impurita-ble in fresh water. The shallower depths also will be much less expensive for wharf construction and

The lakes are, of course, entirely free from tidel fluctuation, which on the sound has a mean range of 10 feet and an extreme range of 18 feet. The fixed level will be a great gain in all shipping operations.

The foregoing advantages are of a general character, but there are others of a purely local character that are very important.

that are very important.

The cost of arrayage in Sentile is large because of
the extremaly uneven topography of the city and tha
sheurce of good grades leading up from the present
water front. The canal will flank the hills, distribut
ringlet throughout the city and reduce the cost of
drayage, it is estimated, by 25 to 50 cents a ten. This
write will be a few years qual the local contribution to the cost of the canal.

The lowering of Lake Washington to the level of

Lake Union will drain all swamp areas around the shores of the lake, relieve the valley of Black and Duwamiah rivers of the floods of Cedar River by turning the latter stream directly into the lake, a mag too cases' acream circerty into the lake, and will make the whole runoff from the Lake Washington and Oddar River watersheds (540 square miles) avail-she for power at the lock site. Drainage, flood protec-tion, and accessfullity to shipping will greatly schanoo and values around the lakes. Lake Union will be-come virtually a great dock in the vary heart of tha

city. The removal of the natural between the two labes and the establishment of a connection with the base of the setablishment of a connection with the control of the con

chamber. The large lock or chamber will be about 800 feet long by 80 feet wide and 26 feet deep and will take any vessel likely to visit Puget Sound for many years to couse 'the little lock will be 180 feet long by 30 feet wide and 16 feet deep and will be used by small craft of all descriptions, the number of which is very large and rapidly increasing. Probably 90 per

ent of transfers of vessels will 'se through this los The entire structure will rest on an excellent for dation of very hard, tenacious hits clay of great depth It will be built of reinforced concrete and steel and It will be built of reinforced concrete and steel and will embody the best features of modern lock con-struction. The controlling works at the fock will con-trolling the controlling works at the fock will con-trolling the controlling works at the fock will con-trolling the controlling works at the con-formed by the lake gives complete control of the rea-of and distributes the flow quite overly throughout the year. The revenue from this power will resture about it per cent on the cost of the plant and will about 14 per cent on the cost of the plant and will pearly pay for the future operation and maintenance of the canal The problem of maintenance will be greatly simplified by the entire absence of sediment in the water and consequently of deposits in the canal greatly simplified by the entire absence of sedimen in the waler and consequently of deposits in the cana and the necessity for dredging The physical problems involved in the building of the canal are of the sim plast chara

is canal has been the droam of Seattle e it began its existence, but the rapid growth of the city and the great variety of interests affected create oppo-aition here and there which has succeeded in delay-

WHY BAND SAWS BREAK

To the Editor of the Scientific American Mr II Miner of Lumberton, Miss, has inserted an MY it Miller on Lummerron, Miss, has inserted an article in your valuable paper, the Stavrict America va of November 19th, 1909 concerning the causes of breaking of springs. He also relates the breaking of bandaans, which is a very important point to overcome, as it is a well known fact to all who use bandsaws that a saw after running a few hours becomes longer in the back edge on account of the back pressure from the saw guide which gradually brings that tension more and more toward the teeth or sawing

if any little cracks exist by reason of in If any little crasses exist by reason of improper in-tabling they will certainly increase and the flaw will break. If the manufacturers of bandsaws would study this matter they would soon find out that the fault lies in the carticsa way of making the sleet and pre-

Manufacturers who have won reputations for mak Manufacturers who have won reputations for mass ing bandsaws in smalkr sizes as from % inch to % inch, are looking for too great a profit and forgot to make use of the same skill exerted in making band-

Hy an average approximate estimate a % juch band-saw will not run long enough to wear for nuc-haif dozen filings before it is broken in so many places dozeu filings before it is brokeu in so many pullibat it is impossible to make any more use of it.

H JOHANARN

A CURIOUS PHENOMERON. To the Editor of the Scientific American
While driving along the share of Canandsigua Lake, in the State of New York, on Tuesday, January 4th, I observed a curlous natural phenomenou

The temperature of the air was six degrees above sero, a light northwest wind blowing and the bright sun of the afternoon occasionally obscured by the pres of large and low hanglog cumul us clouds.

The surface of the lake was covered by vacor caused by the difference in temperature between the cold air and the comparatively warm water. This vapor visit and the comparatively warm water. This vapor visi-hie in the form of a slowly rising, dense, white mist gathered in spots in masses rising higher than the surrounding mist. As these masses of vapor reached a height of some twenty feet they appeared to take on a rolary motion and formed themselves into columns slowly rising until their apexes met the lowlying clouds, where they spread out in a funnel shape ex ctouns, where they apread out in a tunner snape ex-scily as do water spouts. The columns varied from a foot to possibly ten feet in diameter, some of laem ascending in a straight line and others bent into fan ascending in a straight line and others bent into fan tastic curves by the action of the wind I saw a great number of these mist which during a drive in some two hours, evening a distance of ien miles atong the lake shore, and as they formed and drifted slowly across the water Himminated by the rays of the set ting sun, they were a beautiful and to ino a unique

Can you tell me if similar phenom na are often ob sorved ! TANKS S LAP

Speaking before the Royal Society in Loudon on the subject of magnetic storms Mr E W Maunder super fine-indend of the Solar Department of the Royal Ob-servatory, Greenwith said that magnetic disturbances were in some way connected with the rotation of the sun upon its stm it was clear that, besides sending sun upon its site it was clear that, besides sending us light and heat the sun sent some kind of influence which came only from certain portions of the surface and came along closely restricted line. They close the came of the control that place when a sun spot had got to a definite portion on the sun's dals. If they took it that the influence that came from the sun and struck the earth came from the center of the sun spot, they would be able to calculate how long it had taken place, and, assuming that, they found it would take about to six hours to come from the sun, a distance of \$3,000,-

A GREAT OPEN-AIR TELESCOPE

BY PROF. S. A. MITCHELL COLUMBIA UNIVERSITY

A giant telescope has been rected in Germany hav-ing for its main purpose the making of astronomy popular through exhibitions to the public of the heav inly hodies. The United States has repeatedly followed Germany in her advances along scientific times and here would be a splendld opportunity to emulate for by the erection of a great public telescope (say) to New York clay

A contrast of this new German telescope at Trep-tow (near Reclin) with the highest development of American manufacture proves of the greatest interest in the Yerkes telescope (see Beievithi American De cember 25th 1908) we have a great instrument given cember 2ddi 1998) we have a great instrument given over in taxi rewarth, handled by a corps of exper-astronomers leaders in their special lines of work Prof E Barnard is there with his keen eye for the necessarement of the positions of council, star clusters, etc., for the depicting of slight planetary details, or cit, for the depicting of slight planetary details, or with the help of the photographic plate for the por-trayal of Mars on a large scale. The greatest living authority on double stars i rof S W Duraham spends two nights such week with the great 40 lach refractor The director, throf E B Frost, takes care of the spec-trescope side of astronomy by photographing the spec-tra of stars for the determining of their motions in the line of sight and by day time the felescope is made use of to learn of interesting pho-

use or to tears or interesting pro-mom na about the sun. This great telescope is a model of engineering perfection with its great tube and massive parts rising floor and ro-tailing dome it is mounted in what is known as the equatorial

But how different is the Treatow telescope. Erected with other pur-poses in view, it is not increasary to have expert scientists to keep the telescope curployed almost every hour during the day and night constructed under a different plan it is unnecessary to have a great elevating floor toside of a huge ro-tating dome, for in fact the dome tating items, fir in fact its dome is done away with and the tele scope is used to the open air. This then brings something radically new in the old setting of an ordinary, something unitrily different in the construction of a great tele strunced bus owny points in its favor that make it a most interest

The director of the Trentow Obry, fir F 8 Archenhold, by

his radical ideas came into opposition with the Ger man scientists who ridicated the idea of placing in the open air with no protection from the wind a great the 683/10 feel in length seven feet longer than the Yorkes telescope (62 feet) But undausted, Dr. Arch enhold persevered and finally succeeded in tollecting sufficient that for the crection of the ingress tele-acope in the world. And this, too in actentific Ger

many:
The front page illustration shows the Troptow telescope. The old equatorial form of monotting was described by the first partial from, for this requires that the eye-ond of the telescope be raised through a vertical distance approximately half the tength of the telescope tube in viceling, a sign overlead and one near the horizon.

This recognition is not provided and one near the horizon. victing a star overlived and one near the horizon This measurated a very expensive observing floor run by electric motors (Schwitze Amarican, December 25th, 1908). By sufficient the telescope tube in a great fork and employing suitable counterpolace. Dr Arch enhold was able to have the exceptere over the center. of motion and run the telescope tube upward into referring to the illustration. This climinated the rising floor and saved many thousands of dollars. The low forked mounting with its heavy movable parts plered on a solid concrete foundation insured a stable lostrument and as the whole construction had no

preat height it became possible to house the telescope by turning the long telescope tabe into a horizontal position and pulling over it a cheap portable house position and pulling over it a cheap portable house in Juning the tescope in the open air it became possi-ble to entirely eliminate the great dome, and thereby save again more thousands of dollars. The result of those plans were that Dr Archeabold was able to built the completed instruments for the modest sum of 802,500 Off this seam \$11,500 was apart for the time, which was made of the colebrated Jensa giass ground by the old-scatchibled from of ticninks, in all the seam of the s

care reasonal departure from old-established forms is climinating the dome has many points in its favor bedges the mere saving of money, and siso many drawback As is wall known to astronomors, the temperature of the night air is continually failing (especially in the early part of the night), and it is impossible to have the air in the interior of the dome at the same lemperature as the outside air. This causes the heated air to pour out through the sit of the dome, and also produces currents of air in the interior of the telescope tube itself. All of this makes "bad seeing," and a distortion of the telescope image. distortion of the telescopic image-

ry to drive the telescope to make it move it is necessary to drive the telescope to make it more from east to west, otherwise overly to the earth's rotation the object would quickly more from the field of the telescope in the Trepton telescope both observer and instrument must be moved, and the datalis of how this is done by a ¼ horse-power motor regulated by clockwork can be seen in the smaller illustration.

The Cost of Our Havy.

IT COSTS A GOOD DEAL OF MOREY TO BUR A NAVY The actual expense of running the navy of the United States for the past fiscal year amounted to \$48,790,000 in this sum is included everything, from the pay of entisted men to the repairs and equippage of vessels.

And the vessels include the tugs and receiving ships sa well as the battleships.

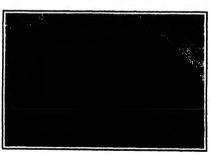

as well as the battleships. The latticeships of the Atlan The battleship "Cannet ticut," flagghlp of the Atlan tic fleet, may be taken as an oxample of the cost of the type in service. The pay of offers and califated men attached to this vessel with the other expenses amounted to more than \$198,000 during the flees! year just passed. The Atlantic fleet in that privide included siztees of mix-tleast war vessels in that privide included siztees of mix-tleast war vessels. vis., six of the "Connecticut" type, five of the "Georgia" class, and the others ranging from 13,000 tons to 11,500 via, sin to the chars vanging from 13,000 tons to a character of the chara

including repairs, is \$677,500 a year The classes below the "Georgia" re The classes below the "Georgia" re-quire expeditures ranging from \$532,000 to \$604,000 White the fig ures will vary for the armo vessels in different years, the cost changes vary little from year to year for the same class \$10.521,000 was the total cost for running the sixteen ships of the Atlantic fleet for the peat year There were twenty three first-class battleships in commission last year, and the total cost of keeping them in service exclusive of repairs, was \$13,035,000, making an average cost for running them \$592,084 On all these ships the repairs amounted to only \$100,-

It might seem atrange, but it is a fact nevertheless, that it costs more to maintaic a cruiser than it

a fact seventheless, that it costs more to maintain a cruiser than it does a battleship Three were ten it does a battleship Three were ten it and the seventh of the sevent

View taken under the mounting, abowing the electric motors for driving the telescope. A GREAT OPEN-AIR TELESCOPE.

Dr Archenhold s pian of doing without a dome elimi-nates most of the effects of air currents, for there is no "dome effect," as astronomers call it, and the air in the telescope tube quickly takes the temperature of that outside Here, then, is a decided advantage of that outside. Here, then, is a decided advantage in the unfortunately the toleccope being in the open air nakes it the sport of overy passing wind, and aven a night wind is agit to set up a vibration in the tole-scope, especially so when the tube is so long as in the Archenhold (descope, which is supported not in the middle, as in the ordinary tolescope, but entirely as it middle, as in the ordinary tolescope, but entirely as it. one and Though the vibrations may be small and imperceptible to the eye, still when the telescope in poleted at a fixed star the immeane magnifying power of the long telescope would make oven the slightest fremore readily visible and would spoil the use of the fremore readily visible and would spoil the use of the instrument for accurate work. It would seem that for the important researches of the exact astronomer the operaint inslessopes would be a failure, but for pub-tic exhibitions only it is another story. The absence of dome and rising show elliminates a great amount of the expense, and the modelet amount of the sopular aubscriptions can be all put into the construction of a telescope thus obtaining a much larger instrument. The telescope is raised and a star located by means In ord of a 61/2-horse-power electric m come pointed correctly at the s

AMERICA'S FIRST AVIATION MEET AT LOS ANGELES

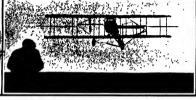

DETAILED ACCOUNT OF THE FLIGHTS MADE BY THE AMERICAN AND FRENCH AVIATORS

The first aviation meeting to be held in this country opened at Los Angeles, Cal, on the 10th instant. Louis Paulhan, the record-breaking French aviator, was present with two Farman biplanes and two Bieriot monoplanes. America was represented by Gienn Curties, C. F. Willard, and C. K. Hamilton, all of whom few Curties biplanes. The field their serveries are as as not present the country in biplanes. The field that serveries are as as no

drome was located a few miles from Les Angeles. It was not as lides likes for flying eines it was not level. One end of the field was at a considerably higher elevation than the other and the machines were, therefore, obliged to fiv quite high in order to pursue a level course. A hexagonal course of 161 miles was used Only a few short flights were made by Meanr words of the contract of the contr

Curtiss and Willard the first day Mesers teachy and Khabenshus, in their dirightile balloons, few 200 feet above the grand stand against a whind of 10 to 12 miles an hour Paulhan made his initial sight of 1% minutes at this time, covering an evil mated distance of 1% miles. In the second flight he rounted aloft on minutes. Bits third flight hated 29 minutes is

The two Farman biplanes flying in front of the grand stand.

sides dashing at the grand stand and just clearing the heads of the speciators, he flew out of sight over the neighboring ranches

On the second day the first flights were made by Paulhan, who look out his new Farman biplane and drove it thrice around the course in a stiff wind, said to be of 18 miles an hour velocity, which was be from the ses. Nort for variety he mounted one of the tiny Bieriot monoplanes, with which Miscarol had been attempting to get off the ground—ite had no difficulty in flying it is the wind that was blowing. Although it bobbed up nid down and was toward about like a small boat on an augry wa Paulhan flew about the field and several times swept past the grand stand, perfor various manuaces and rising to an estimated height of 200 lot | The spectators gave a sigh of relief when he flually landed across the field from the stand | He was seen out age'n with his Farman biplane, in which he quickly disappeared from view far to the north Shortly after he reappeared over the trees of a nearby ranch, and frequently charged at the grand stand, turning aside just in time to cicar the succiaiors or cise to sweep over their heads. This flig 5% initial lasted 21 minutes and 12 seconds This flight of abo It was the fourth flight he had made on the second day of the After ('aulhan's flights, Mr Curtise brough out his Rheises racer, which is fitted with an 8-cylinder unter-cooled motor of 50 horse-power Mr Fanculill climbed on board with Mr Curtiss, and the machine shot lain the air for its speed test with a passenger After describing a wide circle in front of the grand atond Curles flew around the course at a speed fig ured out by ident Paul Beck, of the Army Signal Corps—one of the judges—at over forty miles an hour Paulhan immediately started a flight At the same time Measure Williard and Hamilton started or Curiles followed them a few moments aft

Clifford Harmon as a passenger All four machines were flying at the same time a spectacio well worth seeing Paulhan landed a worth seeing Paulhan landed a few minutes later, took on one of his mechanics as a passenger and twice circled the course as readily as he had done slone

Curiles established a new start ing record and also a record for landing but Willard best Curtiss in the latter respect. Curties start od frum n marked square of square feeet flow miree around like field in something over two min uses and landed exactly on fire aquare from which he started He broke his own record for starting by selling of the ground in 62/5 by galling off the ground in 6.275 seconds after a run of but 98 feet Paulhan required 12½ seconds time and a run of over 100 feet The great event of the third day

was Paulhan's successful attempt at breaking the world's record for altitude. The existing record had

een made only six days before by ifubert Latham at Mourmelon, France, with his Antoinette monopiane, and was 3,444 fee! Paulhan started in front of the grand signd, and heading north, he went steadily upward in circles until he was nearly a mile high So high did he fly that to the even of the outcokers the machine appeared the merest speck in the sky After ascending some 46 minutes, he pointed his bi piane once more toward the carth, and came down at a much greater angle and in about one-sixth the time (7½ minutes) The registering baromejer on his ma chinn registered 1535 meters or just over 5,000 feet, so that Psuihan had apparently beaten Latham's re ord hy some 1 500 feet I is was given a great ovation upon landing The total length of the flight was 53 minutes 46 1/5 seconds Paulhan a height, as meas-ured from the ground, was officially determined at

The fourth day Paulhan gave a good demonstration The routh day Paulan gave a good communication of the weight-carrying ability of his new Farman machine which is much smaller and weight 226 pounds less than the regular Farman hiplanes, by taking up less than the regular Farman hiplanes, by taking up his two assistants Maisson and Miscarol, and circling several times around the course with them. Curtiss circled the course ten times in 24 minutes 54 2/5 sec-ands. Paulhan tried to beat this time and failed by five seconds only Previously, he made three laps in S 16 1/5 carrying his wife as a passenger After cir-5 18 1/6 carrying his wife as a passenger After circling the field ho slighted readily in the marked-off square from which he started In another flight of minuted duration he carried fiver Ferris as a passenger. He again rewords to his sensational methods, fifting low over the grand stand, making sharp turns, etc. Hamilton, Paulina, Curries and Wilserd qualities of the control of the contro made a flight with his vertical rudder locked, in order to show that this rudder does not have to be used in connection with the balancing planes, as is done by

the Wright brothers when they warp the planes of their machine to correct its transverse equilibrium.

This combined operation of the equilibrium-maintain. ing device with the vertical radder is one of the arest claims in the Wright patent. Where plane strongest olaims in the Wright patent. Where plane warping is supployed, it is necessary, in order to prevent the slewing around of the machine, when the plane is warped to a greater angle. With balancing planes like those used by Curties, the resistance inplanes like those used by Curtis, the resistance in-serted at one and of the machine is as great as as it, to other, the consequence bolog that the varietal rudder does not necessarily have to be used. This slight with the rudder fustemed demonstrated very well the differ-ence between the two systems. Mr Williard again few once around the course and landed in a measured square, thereby winning a price of 1500 Paulbau was ented with a \$500 allver cup by onthusiastic citi zens of San Diego Tho next day he made a cross country flight of some 16 miles to San Pedro and back circling above the revenue cutters in the harbor and being greeted with theors by the inhabits has also made & circuits of the course with his assist han aiso made 6 ctruits of the course with his assis-tant in 18% minutes, and afterward few twice around it alone in the Bisriot monoplane. His fastest lap in the latter mas hills was done in 2.4%, which equals a speed of 3414 miles an hoar: Ourtiss made the feat cell lap of the course in 2.12—a reped of 4345 miles per hoar: Sinbequent to a race with Beachy, Kasban-shous made a lap in his dirights in 5-10376—rate of shue made a lap in his dirighibe in 5-10.2/5—a rate of 184 miles per hour Hamilton tried for the slow lap prize and succeeded in making one circuit of the course in 3 36.2/5—a speed of 20.78 miles an hour. The time uf Willard's slowest lap was 2 11.1/5 Hamilton made 12 minute flight for altitude, reaching a height of

a 12 minute age --53014 feet.
But very little flying was done on the eixth day of
the meeting, owing to wind and rain. The field was
wet and muddy, but notwithstanding this, all the ayi-

Prof. J. S. Zerbe's muitiplane. This machine is of the following plane type.

A HOVEL AMERICAN ARROPLANE AT THE LOS ANGELES MEET

ators got off the ground without much difficulty and neade a few short flights. Paulban attempted to b Curtiss' ten sap record, but he was unsuccessful lard and Hamilton also made an attempt at this record, the latter covering the 161 miles in 30 34 3/5 or at an average speed of 317 miles an hour Mis-carol, Paulhan's assistant, made a brief exhibition flight with a Bleviot monoplane. In landing, the maflight with a Bieriot monopiane In landing, the ma-cine tipped to one side, causing the wing to strike the ground and break off. The accident was biamed upon the aubstitution for wing warping of the movable ends of the tail, which normally mova together and act as the Borksontal rudder By moving these en act as the normontal rudder by moving these ord of the tail in opposite directions, the transvarse equi-librium can be maintained fairly well under ordinary conditions, atthough this method is not so positive as that of warping the wings themselves. Sunday January 18th, but few flights were made, as the vessiber still remained inclement. The following

day, however, Paulhan attempted to break Farman's record of 4 hours and 17 misutes. After remaining aloft 1 hour, 58 minutes, 27 2/5 seconds, durin time he covered 75 6 miles. Paulhan was oblige ed to de time he covered 76 miles, Paulhan was obliged to the served on account of a leak in the gasoline tank. He therefore did not come within 3% hours of equaling Furnant's record Hamilton also Sew during some of the time that Paulhan was making his codorance flight. He kept at a lower levels and made it circuits of the course, but was obliged to stop on account of motor trouble. Curries lowered this time for the laps minutes, 45 2/6 seconds (40.71 mile His fastest iap was three seconds slower than his best rits latest lay was three seconds slower than his bett. Bankn overed ten hap in his 5 1/6. Beachy made one lay in his dirigible in 4:57 4/5. Beachy made one lay in his dirigible in 4:57 4/5 to 1/14 duties on hour? This was the featest hay second by any dirigible during the meet. "The Gill-Deach biplane, which is very monh illne the Cortina, and which was constructed by two gentlemen from Ballisnoys, life, made everal intempts to got off the ground, but was only successful in sunfate; a five short impus. We Citized Harmon made a short digits alone in his new Curtius mealine. Translay, January 18th, is hoteverthy for the long cross-country flight of Monz. Fuchkan, who flew to "Rocky" Ballwish ranch and hock, a distance of short

cross-country flight of Mona. Faulhan, who flew to Tacky "Baldwis" ranch and back, a distance of shoot 47% miles, in 1 hour, 2 minutes, 48 4/8 seconds. In the course of this light he rose to a height of 1,10 feet, according to the registering barometer carried in the highest height of the time he was at a height of background the second of the time he was at a height of heavy, which was made in about 28 minutes, Faulhan and to fight hagainst a rather strong westerly wind, and yet he is said to have required only about three minutes more returning than he consumed in fights to the ranch Probably at the elevation at which he was ten work of the said to have required only about three mixtures more returning than he consumed in fights to the ranch Probably at the elevation at which he was traveling he did not secondare as strong a wind as was blowing near the earth.

January 11th was given up to the making of a munched of the secondary of the secondary and the secondary and

turned safely arter 13% minutes, naving covered over 30 miles across country without difficulty. This flight was twice as long as that made by Orrille Wright at Fort Meyer last summer in the speed test for the gov-ernment. It is the longest eross-country flight ever made with a passenger, although it was not by any means as hazardous as the one made by Mr Wright.
Other flights were made with Mrs. C. F. Rishon Lieut. Paul Beck, W R. Hearst, and a reporter for a New

R. Hearst, and a reporter for a New .

York newspaper For the second time Lieut Beck tried dropping dummy bombs upon a measured square on the ground While he did not succeed in hitting the mark, he came very close to it, and showed the possibility of dynamiting a warship or a town in this way Paulhan's last flight was way Paulhan's last night was senger It was a cross-country flight of 8 to 10 miles lasting about 20 minutes. Hamilton made three attempts at high flying, rising to heights of 455, 300, and 700 feet, respectively The Gill Dosch biplane was finally made to fly and yanio was maily made to fly and was driven once around the field by Hillary Beachy In descending, however, it was badly damaged Cnrtiss made two laps, but was unsoful in breaking his speed

The last day of the meet, January 20th, Curtims made the longest flight he has ever accomplished

Starting at \$'25 P M, Paulhan had made but two or three laps, when Curtiss went slott about half a lap behind him Mounted on his Rheims racer, Curtiss steadily gained upon Panihau, and after making three laps passed him in front of the grand stand, his small hiplane flying directly above the larger French ma-chine. This was the first real race the spectators had values. This was the arrived rick in a spectators and witnessed, and Curtiss received great appliance. He continued to fly around the course until he had cov-ored 30 laps (483 miles), his time being 16 35 Panihan made 35 circuits of the course (6425 miles) in 13434 The average apoeds of Curtiss and Paul-han were respectively 378 and 2577 miles an hour has were respectively 178 and 2877 miles an hour thanflion made a slight to Messes, about 7 miles from the aviation field. He rose to a height of several houseful field and disappeared from view upon the horizon. Upon his return the crankshatz of his motor broke when he was nexty back, and he proceeded in gilding down to the field and nighting without make the contract of the motor of the hist day was a parend showing the contract of the cont

TOOL FOR GUTTING STAY BOLTS

Stay bolts in locomtive boilers usually break near the inner side of the cutside boiler sheet. When the broken bott is in position behind the frame of the ico-motive it is necessary to drill the bott on the firebox and drop it out of the way, after which a hole is bored

TOOL FOR GUTTING STAY BOLTS

through the giub in the outside sheet and the part of the bolt remaining is cut out with a round nose chisel.

This is difficult to do, and it sometimes happens that This is difficult to do, and it sometimes happens that the shoot is grooved in the operation, and trouble is caused thereby With a view to overcoming this diffi-culty the tool limstrated in the accompanying engra-ing has been invanted. It consists of a cutting mem ber arranged to movo in a sheath which can be ditted into the hole drilled in the bott and serve as a guide into the hole drilled in the boit and serve as a guide for the cutter which is then operated to cut out the boil. The body of the tool, which is of heanousi form, is indicated at A. Projecting from the body A is a blade B formed with a bead C at its tower edge The sheath above referred to it is indicated at D and is formed with a central bore to fit the bead C and as to its receive the fist portion of the blade as in all cated in Fig. 2. The sheath D is reduced at B to Grom a centering guide. The bott to be removed in form a centering guine. The solt to be removed in first drilled out, as indicated in Figs 3 and 4, to the diameter of the part H of the sheath. The portion H is then fitted into the bore, after which the cutting tool is operated to drive the end P of the blade into tooi is operated to drive the end F of the hlade into the bolt and cut it out as indicated in Fig 1 Aftor the bolt has been cut at three or four points it may easily be knocked out. Mr William Smith of Peab-tigo, Wis, has secured a patent on this new cutting

TILISING ORFILIFORAL FORCE FRACTICALLY, Dr Abbert C. Alberton, has endewnored to turn to precibel use the enormous centrifugal force generated by a rotating body file invention is at present embodied in an actually constructed and operative air compensor, with what success we leave our readers to judge from the accompanying illustration and the fol-lowing brief description

lowing brief description. In each of two parallel guide frames a block is sconnected with the platen rods of a duptex compressor. Through the blocks an axie runs to the end of which is attached a valid-tearring arm. When the arms are thrown foreiby to one side or the other, each block moves beak and forth, beause the centrifugal force produced at the weighted end of the arms is endeavoring to corry the weight off at a tangent to the circle from

an ellipsetdal curve due to the shifting of the block.

The two guide frames, as has been stated, are placed
parallel to each other, each having a block, arm,
weight, etc. The blocks are beld in opposite positions
so that the arms will balance each other and so that
the two hlocks will always reciprocate in opposite
two thocks will always reciprocate in opposite

directions. The means employed to hold the contribugal arms in position, and yet allow them to follow their respective "polisis" consists of a shart between the guide frames with two crank arms, each of which has a relative to the contribution of the contribution of the contribution of the contribution arms are turned by the plans which protected the contribution arms are turned by the plans which protected the contribution arms are turned by the plans which prothe contribugal arms are turned by the plus which profit in the arm-dots. The greater the speed of the rank, the greater the power of the centrihugal arms Because there is no connection between the centrihugal arms and the cranks, the reciprocating action of the blocks is caused untirely by restrifugal force II is a curious though easily comprehensible farther than a curious though easily comprehensible farther than amount of centrifugal force developed was no great

in the machine illustrated that it was necessary to cut away part of the material of each arm and to reduce the weight so that the pistons would not ham-mer against the cylinder heads.

BRACE FOR BRICK KILFS.

During the process of baking bricks the kins expand and contract, and if the sides are not braced after they have contracted they are apt to topple over if the kiln should expand again. Hitherto it has been the custom to brace the sides of a kiln with tim bers and wedges which work involves considerable

BRACE FOR BRICK KILWS.

danger to the workmen while adjusting the wodges ove this danger an inventor has recent In order to remove this danger an invastor has recent by devised the bree illustrated in the accompanying engraving. It comists of a bar A formed with each stang its upper edge. One and of the bar is provided with a pair of stride safquest to capage a curved siot P and the provided of the provided of

gaged by a pawi & which is ful crumed in a member F that is supported on a timber disposed along the side of the kiin. the bar 4 Mr Anatole Perusse (care of J McLess 345 East Strand, Rondout, N Y) has just received patent on this improved brace for brick kilns.

BUTCHERP SCALE PAN.

It is customary for hatchers to weigh meat in large scale pans that are usually provided with a rigid ball which is also of large dimen sions, and the fact that the ball is rigidly attached to the pan makes it inconventball is rigidly attached to the pan makes it inconvenient to stow away the pan when it is not in use. The accompanying engraving illustrates an improved form of the child is so mounted that it may be folded down against the pan when it is

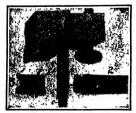

BUTCHERS SCALE PAR WITH FOLDING BALL

not in use, but whenever desired may be locked rigidly in an upright position The ball is not directly con nected with the pan, but to a pair of rails which serve to distribute the strain in our illustration we have icitered the pan proper A. Riveted to the pan at the bottom are a pair of diametrically disposed straps B which cross each other at right angles and are bent up at the ends against the sides of the pan. The two rails C which are curved to conform approximately to the shape of the pan are secured to the ends of the Hinged to these rails is the bail B which is bars B provided with the nausi hook for attaching it to the scales One of the rails U is formed with an outwardly scales One of the Tails of a former with a no unward and projecting fining E. In which is a square aperture adapted to receive a finger F that is free to slide on the ball D. When the finger F is fitted into this aperture the ball is held rigidly in upright position. On Illing up the finger F the ball is reveated and may be folded to the position indicated by dotted lines in the ongraving Mr Jacob Feldman of 70 Cariton Avenue Brooklyn, V Y, has recently secured a patent on this improved scale pan

DOOR SECURER

A very convenient device for securely locking doors has recently been invented which should be of par-ikular value to traveling men who often find it necessary to occupy a bedroom not fitted with an ef lock The locking device may readily be applied to any door without marring it in the least. As shown in our illustration, it consists of two plates. larger pists A is provided with teeth which placed against the lamb of the door and when the door placed against the jamb of the door and when the door is closed on the plate it forces these teeth into tho wood The opposite end of the plate A is turned back upon itself to form a hearing C the purpose of which will presently be explained A square opening D is cut through the body of the plate A and adjacent to this opening a can or eccentrically mounted disk E is provided The second plate, as shown in Fig 3, is formed with bearings F adapted to fit st opposite sides of the bearing t and recrive a screw that passess through the hearings of both plates, being threaded into one of the bearings F. The smaller plate is also provided with a lug G which projects through the open

SIMPLE DEVICE FOR SECURISE DOORS.

ing D in the plate A. The lug G is recessed to receive the cam B, and the latter is turned to press the step Hagainst the door and thus lock it shut. In order to allow for the movement of the smaller plate as the cam N is turned the bearing U of the larger plate is converted as shown in the drawing. The inventor of clongated as shown in the drawing. The inventor of this door securer is Mr Charles W Lent of Tingley,

AW OIL CAM

The oil can illustrated in the accompanying ongrav ing belongs to the class embodying a flexible bottom which is operable to cause a flow of oil

The Construction hat shown, however, is arranged to provide a
considerably greater flow of oil than is obtainable in
case of the conventional construction. This result is
sweared by providing three disphragms in the can, one
of which serves as the bottom of the can, while the other two are connected at the center by a nipple In other two are connected at the center by a nipple. In this manner an oil chamber separate from the main portion of the can is formed in the accompanying cograting the can is shown at A with the usual nosalo. It threaded into the upper and. Fitted into the lower end of the can is a retaining ring C which has extend-ing flauges at the upper and lower ends and is also ing fianges at the upper and lower cade and is also but outwardly at the lower and io fit against a shoulder formed in the can body. The dished dia piragins D and E bear against the fianges of the retain ing ring. The two dispiragins D and E are connected ing ring The two dispiragms P and E are connected at the center by the nipple G. The dispiragm or bot tom F is soldered fast to the can body. An oil chamber is thus formed between dispiragms F and E. In operation when the bottom of the can is pressed in ward it drives the oil from the oil chamber with greater pressure than would be the case if the entire can body formed a single oil vessel. At the same time

TRIPLE-ROTTOMED OIL CAN.

the other two disphragms yield as well, thus effecting a large discharge of oil Mr Frederick G Svetilk of Cadott, Wis, has recently secured a patent on this improved off can

AUTOMATIC WAGON BRAKE

ATTOMATIO WAGON BRAKE.

Two patents insverecently been issued on the subject of wagon brakes, describing a form of brake for use on carriages and wagons, that will be automatically applied when the horse is checked or presses back against the load when going down hill. The brake may also be applied by hand and can be thrown brake may also be applied by band and can be thrown out of automatic operation whenever it is desired to back the vehicle. In order to take off the strain upon tho mechanism when traveling around curves or over rough roads, a firship connection is made between the tongue and the brake me hands in Fig. 1 the tongue is indicated at A. It is provided with a crowned retire and the strain of the meanted on weetled stock which he was realists. is indicated at A it is provided with a crowned rollor B mounted on a vertical axis which bewars against a crown roller C mounted on a horizontal axis. The roller C is carried between two arms of a hrake reach D which are disposed at each side of the main reach E and are free to slide longitudinally in the hounds. The and are free to stide longitudinally in the hounds. The hrake reach D is connected at the rear oud to a lever F which is connected by chains to the hrake beam G. The latter carries the brake shoes that bear against the rear wheels of the vehicle. The hrake beam is connect hy a spring to a post H carried by the main reach E it will be evident that when the tongue is present backward or when the vehicle rides forward on the tongue the brake reach will throw the lever F back ward, drawing the brake slices into engagement with the rear wheels. A hand lever extends upward from the rear wheels. A hand lever extends upward from the lever F to permit of operating the brakes manu-aily In order to hrow the automatic mechanism out of operation the tongue A is locked to the hounds by means of a simple mechanism. It countiests of a lever I with a downwardly projecting flange adapted to engage a flanged piece J carried by the tongue. The lever I is mounted in brackets secured to the hounds iver I is mounted in brackets secured to the sources and is normally spring-pressed on to f engagement with the piece J A cord running from the lever I to within convenient reach of the driver may be drawn upward to throw the lever I, whereupon a latch K will engage a step piece serving to hold the lever in set position With the crosspiece J set as shown in

AUTOMATIC WASON BRANK

wheels, while if the piece J is set with the flange at the opposite side, as shown in Fig 2, it serves morely to tock the tongue to the hounds in such position that it cannot set the brakes.

It cannot set the oraces.

The second construction returned to is similar to that shown in Fig. 1, and corresponding parts are reterred to by the same, but lower-case, lattors. The longue a is connected to the brake reach d by mosans of a chain b which passes over a pulley? The brake reach d is connected to a lover f which in turn is constant as the connected to a lover f which in turn is conreach a is connected to a tover y which in turn is con-nected by means of chains to the brake beam y. The brake beam is connected by a link to the main reach c, and is held in inoperative position by a spring attached to the brake reach d. The hand lever for operating the brake is shown at h. A locking device similar to that shown in Fig. 3 is indicated in Fig. 4 comprising a lever i mounted on the hounds, a iug j mounted on the tongue and a latch k The inventor of these wagon brakes is Mr Eben G Dolan of Starksboro, Vt.

By depos-sing the betierant lever, the knobe will be forced agard, stretching the shoe at the points of contact. These knobs are removalles, and are provided at one siste rounded and the other projecting. Each knob aim-has a square ispered opening adapted to fit the arms plud, either with the prefecting portion bearing spaints the shoe, or with the revended portion, as de-sired

ventor has rece ly procured a patfor rocking chairs, without placing the feet on the floor The particular advan tage of this scheme is that a scheme is that a slight movement of the feet will cause the chair to rock. Fulcrumed to the rockers are

fitted with rollers at one end to engage the floor, at the opposite end connected by means of links to a pair of beli-crank levers forming a sort of a treadle. ing this treedle downward, pressure will be brought to bear on the rollers, causing the chair to rock. When desired, the mechanism may be thrown out of operation by folding the treadle up against one of the pieces of the chair

Bectering Oriental Bugs,
Of the hundreds of thousands of deliars worth of
Oriental rugs brought into the United Bittes annually,
many of them are what is known to the profession
as "washed rugs." This means that brightly colored
Oriental rugs are sometimes washed with a colution
of chorids of line, a treatment which partly bisches
the colors and imparts a coft appearance to the rug.
Tan chemical rustment is a process of washing which
produces the effect of age and a pscullar sheen to the
proof of superfor quality. The fact is, however, that
the process of washing invariably weakens and in
ones instances destroys the materials of the rug. The some instances destroys the materials of the rug some instances destroys the materials of the rug. The progressive effect of the chemical treatment of the rug is this. The chlorins gas contained in the ebberdie of lines attracts oxygen and moisture from the air, by which muristic acid is formed. This cast away the vitials of the fabric. Sconer or later the wool and cotton in the rug become brittle, and thus weakes the warp and destroints the wool. When this deterithe warp and deteriorate the wool. When this deteri-oration is complete, the pile of the rug may be swept away by the ordinary process of sweeping, and the warp, which is the foundation of the rug, becomes so weak that holes appear here and there, and soon the rug is worthless.
it not seldom happens that a Persian rug is too

glaring in some hright hue, perhaps red, and is not salahic. An unscrupulons dealer will subject the rug to the series of washings in chamically prepared water to the series of weakings in commically prepared water in this way he turns ont a rug possessing a soft an itique sheen that is truly captivating, and finds a ready purchaser for the doctored floor covering

A New Comet Biscovered in South Africa.

A new temet Discovered in South Africa.

A new comet visible to the naked eye was discovered
at Johannesburg on January 16th by Innes, in right
ascension 19 hours, 60 minutes, 28 seconds and declins

tion minus 23 degrees, 59 minutes 24 seconds.

At the time of its discovery the comet had an hourly motion in right ascension of plus 41 seconds of time and declination of pins 6 minutes 4 seconds of arc
The comet discovered is hrighter than Venus. At

Lick Observatory it was easily seen with tha naked ope at noon about four degrees east of the sun and one-half degree north of it, moving northeast For a few nights the comet was a brilliant object in

he clear sonthwestern sky just after sunset. Readers of the Scientific American will hardly con Reacers or the Scievific America with hardly con-tines. his commt with Haliny's, which has been the ob-ject of constant study since September 11th, when it was sighted. The South African body is one of the two or three comets which are usually discovered every year

Dr Joseph K. Pogus who is in charge of the Divi sion of Minoralogy in the U S. National Museum, has recently described in the Smithsonian Museum.eous Collections a remarkable spectmen of pyrite studded Ollections remarkable specimen of pyrite studed values of the constraint of the cons unusual occurrence of these minerals in crystallo-graphic inxtaposition is described by Dr Pogue as folgraphic jurtaposition is described by Dr. Pogus as follow: "The pyrite, when the present size was nearly attained, sustained a deposition of grynalized gold upon its surface followed by the precipitation of a small amount of chalcopyrite which, in turn, was succeeded by the formation of the galean. A further slight accretion of pyrite completed the development of the specimes.

Failure of a for-wheel, says Pewer and the Ragineer, unusually begins by the starting of a minute eract on the under surface of the rim at the peint of greatest streas, vin, near the ends of the arms adjacent to the rim joint. The create gradually deepen uptil failures occurs, with all its disastrons onesprenouse. These minute creates are visible to an experienced cap, and careful inspectics will add graduality by the prevention of ty-wheel conjustions.

(Concluded from page 100)
Atlantic type and the six-coupled type which succeeded it in fast passenger serv-ice Commencing at the tender, which is

los Commencing at the tender, when the this carried on two six wheel trucks, a novsity in tender construction. The tank capacity is 4,000 gaillons of oil and 12,000. gallons of water The belier, 6 feet in diameter has 202 square feet of heating surface in the fire box, 3,275 square feet in the fire tubes, and 1,279 square feet in in the fire tubes, and 1,279 square feet in the feed water heater tubes, making a total of 4,756 square feet. In the super-heating and re-heating section there are

1,i2i square feet of tube surface
The firebox is built up of steel plates,
flanged to a channel section and rivoted Sanged to a channel section and rivoted incognher with stay piates rivoted in botween the opposite fianges of the outer and inner shell. The fire tubes, 21 feet long, terminate in a combustion chamber, 10 feet, 9 inches long, which contains the super-heater and the re-heater. The froat combustion chamber, which rms the feed water heater, contains 417 bes, 2% inches in diameter by 6 feet in hes long
The boiler with its superheater and

The boller with its superneaver and food water heater extension is connected rigidly to the frame in which are car ried the pair of trailing whools, the six coupled drivers, and the high pressure cylinders. The low pressure cylinders, the forward truck and the four coupled drivers are carried in a separate frame and the weight of the forward portion of the boiler, feed water heater, etc is iscried upon this forward truk by means of two sliding bearings which allow the frame to move laterally under neath the belier, as the locomotive enters upon a curve. This necessitates employ ing a flexible steam pipe for conveying the steam from the re-heater to the low pressure cylinders and the necessary flexibility is seconed by using both site and ball-and-socket joints in the steam pipe Piston valves are used with both and ball-and-socket joints in the season pipe Piston valves are used with both high and low-pressure cylinders, and the valve motions are of the Waischart type There are two high pressure cylin dors 24 inch diameter by 28 inch stroke, and two low pressure cylinders 38 inch iameter by 28-inch stroke. The driving beels are all 73-inch diameter

The general construction of the freight locomolive is similar to the passenger locomotive, but the dimensions, weights and power are, of course, much greater The bolier is 7 feet in diameter, works The boller is 7 feet in diameter, works under a pressure of 229 pounds, and has a total heating surface, including the feed water heater, of 6 611 square feet. There are also 1,746 square feet of super heating and re-heating surface. There are two high pressure cylinders, 26 inches in diameter by 24 inch stroke, connected to sight-coupled drivers 63 inches in diam eler, and two low-pressure cylinders 38 ected to eight-coupled 63 inch drivers nected to eight-roupled 63 inth drivers The tender contains 4000 gallons of oil and 12,000 gallons of water. The engine alone woights 231½ tons, and the engine and tender together woigh 350 tons. The fotal pull on the draw bar maximum

ower is 54 tons.
It is no exaggeration to say that these ecomotives mark a new era in American ecomotive practice, for although the Mallet system, super-heating, feed water heating and compounding have been tried out separately on various locom tives, this is the first time that these refinements have been embodied so com pletely on a single type

un to come to must not be too credulous, and think that the first object he sees is a comet. Many times I thought I had found the comet and could see even the iall, but it proved to be merely a siar elongated by the shaking of the telescope

Now the same manner of proceeding msy be applied when the court is rear any other star, Hough it will not soon be so desirably located as on the evening of November 18th After the comet is bright enough so one can see its tall and head, one would not need to go to so great trouble but could systematically search a limited and definite area near it, and in a short time would be able to pick it up. But it is not expected that it will be a very conspicuous object in a small telescope before the close of winter or early spring in the mantime the ambilious amateur astronomer can salisfy his interest by studying it in this man-

try this plan, it may be observed that the evening of February 5th is favorable bee of the comet a proximity to English Piscium Epsilon Piscium is in R. A. 0 hr 58 ndn, and Dec 7 deg 24 min From the unhamuris given for February 5th the fullowing is its location on that evening R A ob to formin, and its Doe; is dog and it min Similarly it will be found close to Delais and 62 Piestum on February 17th, and March 5th it will be just north of 51 Piestum R is neution is much slower during February than for the two preceding months, and so its location ought to be an easy task for the ovenings

ought to be an easy task for the evenings immediately before and after these dates. Where the neighboring star is not as conspicuous, as in the case of Aldebaran one must study the constellation and familiarize himself with the stars in it is often somewhat ledlous, as a few weeks ago, when I tried to locate it among the many small stars in Taurus directly above on It is, however, a helpful study the amaieur

I had a very gralifying and profitable I had a very gralifying and profitable study on the avening of January 14th, as may be usen by the cuts January 14th was the evening of nearest approach to Omitron Pissium, but as this was a cloudy night I decladed to try the follow ing night I had searched but a moment or Iwo when it appeared in view I have seen it two or three times since November 30th, but it has never appeared so dis timely as on this evening It is still fainl, though but a few seconds of are faini, though bul a few accords of are in size, and could be easily passed over if the observer is not careful. It looked more like a small nebula. I could not state definitely but it appeared as though it had a faint nu leus. But the mest of the mening's study was the annistakable motion detected as is clearly shown to the cuts. Stars A and B were about twenty minutes of arc The amount of motion could not be determined accurately with the 45power, and the comet is still too dim to power, and the comet is still too dim to use the higher powers. I have had no further opportunity as yet to pursue this place of the sindy but shall at the earli-cat possible monuoti. It will suggest a problem for other amateurs as much delight in the serviciation of the state of the state in the serviciation of the state of the state of the in the serviciation of the state of t in the scrutinizing of Halley's comet as I have already had

It is estimated that the German Empire has nearly 35,000 000 scress of forest of which 319 per cent belongs to the State German forestry on scientific lines has resulted in ruleing the average yield of wood per nero from 20 cubic feet in 1830 to 85 cubic feet in 1904 During the asame period it has tro blod the preportion of the sawn timber secured from the aver-age cut. In fifty-four years it increased the money returns from an average acre-of forest sevenfold, yet to-day the forests are in better condition than ever before

LESSONS OF THE PARIS FLOOD

I is rather surprising that in all the volominous descriptions of the Paris Bood, which have been published in America, there has been given no computes analysis of the meteorological conditions which have turned the usually gentle and treach the later Seles into a rangin forrest, and would unbelievable have in the far famed and beautiful city of Paris. It seems untilizely that any more rainful in the watershed of the Seline could have been sufficient the watershed of the Seline could have been sufficient being the selection of the selection of the Seline Could have been sufficient so that the selection of the

to produce the present enormous flood, and it is prosable that a great part, if not the major part of the flood water, is due to sudden meiting of the snow the term of the flood water, is due to sudden meiting of the snow the term of the flood water, is due to sudden meiting of the snow the snow that the snow

Parthermore the cabled rejorns, referring to earlies streets, hirsting sowers and collegating subways, indicate that another most destructive action of the water must be actively at work. We refer to the subterrancan flow of water under pressure along the face of foundations, subways, severs and other subterrancan massonry work. Where such those contracts are all the state of the same than the subways, severs and other subterrances are the contract of a sever, thore is liable in be a washing away and displacement of the same water of the same water of the same water of the same water of the same of the same water of the same water of the same of the same water of the same of the same water of the same wat

Inquestionably, one result of the flood will be to an indertaking of public works designed to prevent any rejection of the disaster. An obvious plan would be to build a masony resistain wall, or levee, throughout the whole length of the city and for some distance above it, excrpting the work to a height sufficient to prevent any future overflow. So estamates has been been also were arried to an inconvenient height, it would be necessary to increase the cross sectional area of the named either by deciding which is practicable, or low which ming, which because of the great value of the proper by that would have be readened for this

purpose would seem to be out of the question.

There can be little doubt that the overflow at brisk has been greatly increased by the presence of so many nonemer's bridges, each of which embeddiss civil losses, manoring her that greatly reduce the area of the channel, and if the municipal course under the manoring there is unknowned to absence on the course of the channel, and if the municipal course under the manoring the channel.

Scientific American

inicip prevent future overflows the equestion of the obstruction presented by these hridges must surely come up for consideration Judging from the reports it would seem that not only the piers, but the superstructures of the hridges themselves have served to dam the waters and spitt them over the edjoining names.

If the masonity structures were replaced by suspension brifgers or single transate spanning the entire baneal from wall to wall, a great stop would be taken toward the prevention of future floods. But work to Park, the beautiful, aubint to the remeral of so many monuments of the architectural genulus as are fairly by the present succession of picturesque stone arch bridges.

THE NEW YORK DEEP TUNNEL WATER SUPPLY.

UNGED from the standpoint of sound engineering and practical ntility the plan to carry the new five hundred untilion gailon per day Catakill water supply through the length of Manhatan Island in one large deep tuneel, cut through the everalisting rock, is one of the most commendatio projects ever brought before this city, and we feel that a strong to creat the commendation of the control of th

It is unfortunately a fact that is this age of sensationalism there is no more fruitful field for the qualimonage and scarehead writer than that of engineeing vorks of great magnitude, for such works deal with the stupendous forces of Nature, developing to large such as the student of the student of the contraction of the student of the student of the conof technical knowledge and acoud empineering indefound. It is the scalest thing in the world, by a little juggling with figures and a large mis-statement of fact, on write a sensational article (or a series of them for that matter), that will lead the lay public to believe that the project under december is ill conceived and pregnant with hig disaster. For a notable instance of this it is smideral to refer to the agitation against the construction of the Planms Canal on the plans that construction of the Planms Canal on the plans that construction of the Planms Canal on the plans that construction of the plans of the construction of a hunwater-supply tunnel, from one hundred and fifty to two hundred feet believe the surface of Manhattan, have not committed themselves to the achieve without the not exhaustre examination of the hybrical conditions, and the clearest oridence that in econon, durability and public convenience, the tunnel with he a great inmost exhaustre examination of the hybrical conditions, and the clearest oridence that in econon, durability and public convenience, the tunnel with he agreat inment and public convenience, the tunnel with he agreat the across the results of the convenience of the student water in multitudinous pipes and near the antrace of the ground

The proposed tunnel, which will wary in diameter from 11 to 18; feet, will extend from Hill View Reservoir near Yorkers, below the Bronx, the Harlem Rive and through with the full length of Menhattan island, and thence, below the East River, to a terminating point near the Atlantic Avenue Station of the Long leans (Railroad From this point pipe lines near the startes will extract under the Narrows to Staten lained surface will extend under the Narrows to Staten lained

SUPPRAY WITH ARROWS AND THE ARROWS A

the most valuable advantage of the deep tunes matched in that its force Mantatian, Provider, and States, alis of, the water will be delivered at a greater elevation by about 160 feet than would be possible if the survice pipe lines were used, and water will be aviable without pumping on offsee floors up to a height of 260 feet above tide level. This great difference is explained by the fact that the frictional regarding and the survival and the pipe is largely eliminated by carrying the whole mass of water in one large single conduit. Other advantages are the field pipes, the cost of construction and the annual charges will be about 60 per centiles, that there will be no interference with subways and severe, and no opening up of streets during construction or subsequently for repoirs, that failures by breakage will be impossible; that there will be great volume of water at hand in any locality for the centred of large confingrations, and lastly, that by cross-connection of the tunes with the statistic water-supply system, the latter can be subquarded against any operative of supply or other authous example.

HIRB is a description to the the back of the second of the

services the emilities. The "Description of the conditions of the conditions of the conditions of the condition of the condit

The contract called for the development of \$5,000 maximum horse-power and as poed of \$1 knots. In the trials the engines developed a mean horse-power, not not not runs over the mile, of \$3.675 and a mean speed of \$21.44 knots. The maximum horse-power developed to read single mile was \$3,000, and the maximum speed \$21.98 knots Interest, naturally, centered on a comparison of the performance of the "Delawara" "histon engines with that of the "North Dakota" turbles, and although the turbless drove the ship at higher speed, and with a smaller coal consumption per horse-power, the references the summer of the "Delawara" but the proper, and with a smaller coal consumption per horse-power, the references the significance of the "Delawara" turbless of the "Delawara" turbless

In the 84-boar run at 18 knota the "North Dakoda" marned 290 tone of coal, with a water consumption of 1929 pounds per horse-power per hour, and the "Delian ware" 315 tone with a water consumption of 1628 pounds per horse-power per hour on the 184-boar run at 12 knots its Morth Pathota' burned 105 tons with a water (North Pathota' burned 105 tons with ware" 111 tons with a water consumed per hour by the turbless of the "North Dakoda" at 12, 19, and 21 knots respectively was 18,000 pounds and 1840,000 pounds Theoremsettive consumption for the "Delaware" for the main pounds. These figures, considered on the score of cisan economy, are greatly in favor of the resiperacting segine, and they indicate that the cretaing segine, and they indicate that the cretaining segine.

the "North Daksta" Why then, it may be asked, is the government committing itself to the steam inribies as the drive, for the treature battleshies? The answer is, first, that the "Dakstais" turbines have been greatly improved on no is later models. The number of expansion stages has been increased, and the steam economy has been increased and the steam continued by the steam of the Curist turbine both in Dagitate stad (formany) until it equals and long maries engine. An even more important consideration is the fact that the steam tirrities, with fewer working parts subject to breakdown, is a far more reliable engine. It can be driven all day long at the highest speed, without incorring any additional results of falliur; whereas when the reciprocating engine is always precent, even in the beat-constructed angines, and throw the whole engine out of commission through the contraction of the steam of the contraction of

The Prench Deputies were presented resulting with specimens of the new atmaintant coinage with which is proposed to replace the bronze coinage with which it is proposed to replace the bronze coins in Primose. The 10 centimes pieces is described as "hostellate lawrence a country-and as trougher settings," and is hald to be even jess attractive in appearance that is, michael to coin, and to be "engly and tumbed?" "The "host" is much the same, but, if correls, rather smaller, and it is expected that both, if then are deputed, will pease

ENGINEERING.

An appertnessed roof has been constructed at Traro, which it is claimed has the advantages of being registent, most and dust proof, noiseless, and requiring as removal of the old aurânce. It consists in sublet, down on the roodway sheets of expanded exinding to those so largely need for the reinforcement of concrete, and large greet it a 3 link depth of concrete, and large greet it a 3 link depth of confidence of the control of the contr

The fast plans of the new Argustine dreadnoughts have now been passed. The shire will be called called a bare one been passed. The shire will be called called a bare one been passed. The shire will be called the passed that the passed that the passed will be 22 knots. There yield, it is said, be two funneds and two skatelon musts of the new American type. The whole of the twelve gauss will be ace on either broadside. The contract for these ships has been swarded to the Twen River Works, and in view of the fact that there was been buildened to the world, the securing of this contract is a high tribute to American Highlighting.

a high tribute to American shipbuilding American Company has been organized to build a line from Testutian, State of Pusha, through the Sistae of Venezura, to the port of Nanita, asynchemical transport of Sistae of Venezura, to the port of Nanita, asynchemical transport of Sistae of Venezura, the Mexican Lierald. The \$2,000,000 gold capital has all been subscribed, and Singineer Leopoldo Villarest, a momber of the board of directors, says that the line will develop a region rich in fruit, supar, roffeel, etc., and that the freight on the irmon trade since will pay the expenses of the road A branch line will also be operated between Papanita and Misantia.

According to the United Service Gasatte, the first attribut for the Brittish nary, which is now being built by Vickers, Sons & Maxim, will be the largest result of the kind in actitations (I will be over 600 foreign been beingth and driven by two motors of 200 horse-power, which will be capable of driving the vessel at 6 miles an hour in still air The nominal litting prover will be 35 tons, although its unual tools, articular provers of the strength of the s

The French formal Le Radium describes a long series of experiment made by liken, of Rome, in regard to the presence of therium in various earths and rocks. The proportions of therium found expressed in millionths of the weight of the mineral, were as follows: Roman regetable earth; 14C, grantle from the Vosges Monstains, 897, granite from the Vosges Monstains, 897, granite from Lako Magair, 314, "attorns specimens of synalic, 520 to 528 forms, 314, "attorns specimens of synalic, 520 to 526 Gobard tunnel, gave the following quantities of thorough the synalic specimens of the principle of the Pri

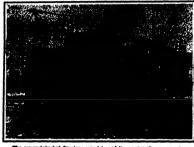

A NEW STORAGE BATTERY STREET CAR

ANOTHER EDISON INVENTION.

The announcement was made about nine years ago that Thomas A Edison would soon piace on the mar-ket a storage battery that would be much lighter and of greater capacity than the usual battery and pro-vided with positive and negative elements that would not deleriorate because in place of an acid an alkali would be used for the electrolyte Much was promised

showed no serious effect when rapidly discharged, and no damage resulted from overcharging Shortly after the batteries were placed on the market it was found that batteries were placed on the market it was found that the graphite became oxidized and interfered with the ontput. After considerable research it was discovered that chemically pure nickel could be substituted for

ous one. They had to be about the size of a lead pen-cil, namely, quarter of an inch in diameter and four inches long, with the sides intelly perforsted. A ma-chine was eventually built which made the tubes out of perforated nickel ribbon. The ribbon was wound spirally with the edges of the coils interfocked and fast-

The car weight but five tens complete and its construction repres a radical departure from common practice

Interior of the car with the scats raised to show the batteries placed in the steel girders. A NEW STORAGE BATTERY STREET CAR

for this battery, and a year or two later it appeared The positive element consisted of nickel oxide inter-spersed with layers of graphite and packed in perforated nickel tubes, while the negative element con stated of iron oxide and the electrolyte was potassium hydrate. Both elements were supported in nickeled nyurate non riemans were supported in negeted steel grids. The battery weighed about half that of the usual signage battery of the same canacity. It

liut soon another difficulty developed. The nickel was packed in tubes of square cross section and those tubes packed in tubes of square cross section and these tubes would buckle or bulge outsard, permitting the pow dered nickel oxide to filter down over the pure nickel isyers and insulate them Then it was determined that a round tube would have to be used which would withstand the pressure of the nickel oxide The prob-

amount of money was spent in solving this one pro-lem of the battery.

Shortly after the batteries were first put on the markst they were withfrawn on account of the de-fects above sommerated, and about two years ago when the battery was finally completed in its present form a large number were sent out to be tested on auto(Continued on page 132.)

ARTIFICIAL PRODUCTION OF THE VOICE

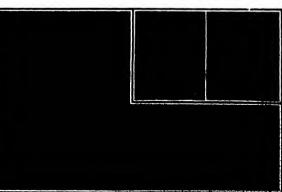

BY JACQUES BOYER

Dr Marage has succeeded in demonstrating, by nu merous experiments, that the voice results from an intermittent vibration of the laryax and the air with in II, reinforced by the resonance of the mouth and intermittent vibration or the larynx and the air with in II, reinforced by the resonance of the mouth and other cavities situated above the larynx in a recent communication to the Paris Arademy of Sciences, Dr. Marage supplements this demonstration by proving that the larynx alone suffices for the production of these vibrations In the first of

these later experi performed ments, performed on a living person Marage succeeded in nullifying the action of the hec-cal cavity by fill ing the mouth with 'sleut,' a substance which is used by ing impressions of the mouth The steut which filled the mouth was traversed by a ri gid tube which connected the lar-ynx with the externai atmosphere Al nant cavity of the mouth was thus suppressed, the five laryngian vowel laryngian vowel sounds OO, O Ah, Ay, and Ee, were enunciated distinct-

ly by the larvax The investigation was continued by endeavoring to profrom a larynx detached from the body Mutter had airwedy experimented with the dead and toolated lar directly experimented with the dead and toolated lar different from those of the living larynx, and he stretched the rocal cords by applying forces much greater than the museles of the larynx can exert These forces, which in some cases exceeded a weight of 24 pounds, vould certainly have torn out the sur-

noid cartilages of a tiving human larynx. Hence the conditions of Multer's appriments were shoomed Marage employed, in his experiments, the larynx of the dog In order to spars the animal useless suit of the dog In order to spars the animal useless suit fering, morphise was first danistated hypodermically and, three hours later, the dog was put under the influence of olilorotorum, and the larynx, with other largest and the spars of the control of the co excised. reneration of sas. For a time, this answered But generation of gas. For a time, this answered But the gun grew, and the exposed surfaces of the greater powder charge required offered too large an initial burning area, and dangerously high and sudden pre-gures were produced at the breech of the weapon. there was actually more smoke than before, the bores of the guns were quickly fouled and there still re-mained a wasteful percentage of unburned grains Such was the state of the art in this country when we wont to war with Spain

Weight of sm. @ tens; Weight of shell, 140 pounds; Powder charge, 56 pounds; Examic velocity, 5,000 feet per second, Musale compy, 45,007 THE NEW 14-18CE, 45-CALLEGE OUR NOW UNDERSOING THAT FOR THE NAVY.

which they fail—the average propolates force being but a low percentage of the maximum power orylend it is this average pressure that most the shot on its seer is to have this reasonably high while lowering the creat of the curra of maximum energy. The first remedy tried was in the form of larger grains, so that, for a given weight of charge, the spec-ficial area at once exposed to the finne should be re-tained to the contract of the same should be re-tained to the contract of the same should be re-tained to the contract of the same should be re-tained to the contract of the same should be re-tained to the contract of the same should be re-tained to the contract of the same should be re-tained to the contract of the same should be re-tained to the same should be re-tained

duced—as power instead to going on what a maps flash burned more slowly, and the propelling force was better distributed along the bore of the gun. This method ted to the making of prismatic grains up to an inea and a half in diameter—regularly and care-butly formed. Next, a hole was bored through the

Besides this, a big percentage of the grain was blown out of the gun unconsumed Advance for a time was blocked until the powder makers evolved a "slowhurning" propellant by changing the proportions of some of the ingredients. The purpose of aniphur is to lower the ignition temperature of the powder, by lessening this element inflammation was more the element innamiation was momen-tarily retarded By increasing the charcol a greater percentage of moisture was added, and that served as a stoving-up agent in the general combustion of the mixture. The powder that developed was called "co-ons" because of its color—the consequence of the undermixture. In position of the under-coa" because of its color—the consequence of the under-charred charcoal used. In this country, we later called it "brown prismatic." The terms "quick" or "slow burning" are merely relative. In either case we are

Smokeless powder has quite reversed the task of the ordnance engineer. His aim now is to provide an ex-plosive which can be made to suit the gun rather than to fashion the weapon to meet the violent vagaries of the older propellants. Our present smokeless powder generates a relatively low regular, and progressive pressure from the instant of ignilion up to the timo the shol leaves the muzzle of the gun with its maximum velocity. The curve of our big 12 inth rifles shows how much nearer the powder makers have come to solving the problem, but much patient experiment-ing has yet to be done before the ideal is measurably

approached

The operative cycle of a shot moving along the bore the operative cycle of a shot moving along the hore of a gun in searcity opposite to that of a train of cars gaining full speed from a standetill tu the latter case, the engineer knows that he would endanger his cou-plings—even if he did no other damage—if he opeued wide the throttle at the instant of starting. So he begins by just acquiring headway and then gradually facreases the motive energy until the train has reach ed full speed—a matter of quite several minutes for a fast train and during a distance of a mile or two. The ordnance engineer, on the other hand, can give to his projectile only a flying start by suddenly applying a great and violent pressure, and enough of this propulsive force must follow the shell to the mustic in order to give the desired maximum velocity. This in order to give the desired maximum velocity russ must be accomplished within a period of not more than one-hundredth of a second of time and in our biggeet guns, while the shot travals a distance of not more than fifty feet A few figures will enable us to realize better the task set the ordnance engineer and

STATES OF THE PARTY OF THE PARTY OF THE PARTY OF TAXABLE OF TAXABLE PARTY. AND STATES TO STATE OF TAXABLE PARTY.

the part that smokoless powder plays in the result when measured by the power to strike an appalling blow The shell leaves the mazzle of one of our latest 12 inch, 45-caliber rifles, with a velocity of 2950 feet a second—13 52 miles a minute—and has a striking force at that instant equal to a blow of 52,632 foot tons' A fast express of 350 tons, thundering along at the rapid rate of 9834 miles an hour in collision with a standing object, would be able to deal a blow with a standing object, would be able to do it is blow of exactly corresponding magnitude. The gun's mis-alle weights but 870 pounds and the charge of powder 335 pounds, such is the power concentrated in our fees propellent and set so wonderfully resu lated is the development of this supendons enorgy that the weapon is actually less taxed than the older 125-inch rifle dealt with in the diagram while the

present-day gun has far more military value.

Referring to our diagram we see how far amokeleas
powder has mado it possible to improve upon the per-formance of the Armstrong gun of the "eighties".

That gun fired a shell of \$20 pounds, used a relarge of 130 unneds of black powder and gave to its shot a the shot left the gun it had a striking the ray of 10,980 foot tons. To day our hig 12 inch rities weighing but forty-old per cept more than the older weapon, can send their \$76-pound armor piercing shell on an errand of destruction with an initial speed of nearly 3 000 feet a second—delivering at the muzzle a blow nearly five times as great as that of the Armstrony gun. The '84 on gun with a powder charge acarcely more than a third of that now used, developed the dangerous maximum pressure of 24 tons to the square inch in the powder chamber Our hig "tweives" 365 pounds of an okeless powder-flavo a maxim chamber pressure in service of not more than 16 tons.
This means a reduction of stress upon the breach of the weapon of quite 33 per cent and yet yielding an average propulative pressure of something more than average propulative pressure of something more una-fol per rent greater, all because the present powder burns slower and oxerts its driving power for a longer period during the passage of the shell stong the bar-of the rife. It is the difference between the shock of a single, sudden, violent impulse and the better-sus-iained jush by which an object may be set in motion and acculurated

irely these are truly astonishing strides, and yet birusively have they been made from year to year that but few of us have realized their extent and their significance in strengthening our powers of de-fense and of retaliation. Buch are the echievements of loday. What may we not expect to-morrow? (To be continued)

A NEW UNITED STATES HAVAL GUN OF GREAT POWER. A REW UNITED STATES HAVAL OUR OF GREAT POWER. Our illustration of the new naval 14 inth gun can-not fall to oxcite widespread interest among those who are following the trend of development in the United States may The piece was constructed at the Mid valo Works from plans of the Bureau of Ordnance, and received its finishing touches in the navai gun shops at Washington it is now undergoing tests at the in-dian Head Proving Ground which are giving much satisfaction to the officers of the Bureau

ms to be a growing conviction ame of the leeding naval powers that, in view of the fact that future engagements will be fought at long ranges at which the remeining energy increases greatly with an increase in the size of the gun future dreaduoughts will be armed with a piece of larger caliber than twelve inches Great Britain is hullding, if she has not already completed, a 13½ inch gun, and our 14-lnch piece has been designed and is now being tested, with a view to putting our pavy in a pe to arm future dreadnoughts entirely with the 14-inch if it should be deemed desirable to do so

If it should be deemed desirable to do so
The new weapon, which will be 46 cuitlers in length
(that is to say its length will be 45 times the bors),
measures over all 50 feet \$\frac{4}{2}\$, inches, and it weight \$\frac{4}{2}\$
tons It fires a projectile of 1,400 pounds weight with
a charge of \$\frac{4}{2}\$ to pounds of smoothese powder and the
shell leaves the mustic of the grun with a velocity of
200 feet per second and an energy of \$6,557 boot-tons,
the contract of \$\frac{4}{2}\$ to \$\frac{4}{2 2,600 feet per second and an energy of 65,687 foot-tons. It will be noticed that the velocity is 350 feet a second iess than that of our latest 12-lnch gun, but that becau of the heavier shell the mussle energy is greater of the heavier shell the mussle energy is greater. The lower velocity has the great advantage that the pres-sures and temperatures in the bore of the gun will be less and therefore the creaton will be reduced and the life of the gun before the riding is so badly worm away as to destroy the accuracy will be conside The method of construction is somerally simi iar to that shown in the accompanying article entitled "What Smokeless Powder Has Made Possible"; and, except that the powder pressures are lower, the cur-of pressure from the powder chamber to the musa is approximately the same for the two ple

The telescope which is being installed in the Transvani Observationy will be the second largest in the British Empire it will be % feet long and have an apriure 26 inches in diameter.

The Borkefeller Institute's Work on Infantile Paralysis.

The psychic machinery in our body is made up of two systems—the cerebro-spinal and the sympathetic, the latter does not here concern us. The cerebro suinal system is made up of the brain, the spinal cord and the norves, which are derived from the cord and extend thence to the muscles, the skin, and the uttermost tissues. The basis of this nervous system is the nearone, composed of a cell body (gray matter), and its dendrites or fibers (white matter) which emanate from the ceil like the roots of a tree. The ne are sensory and motor, and infantlie paralysis is an affection of the motor neurone. The whole is like a tolograph system. The Shore (which make up the nerves) are the telegraph wires, the cell bodies (as grouped in ganglia) are the telegraph etations, com-municating by their fibers with the extremities, with one another, and with the main office in the brain

The sensory ganglis in the spinal cord, to which ensations are telegraphed from the surface of the ody, are in the posterior "horns", thence the sensations are transmitted to the brain cortex, from which in return commands are sent down through th ganglia, in the autorior horas of the spinal cord to the king the affected are

uscies working the affected area.

Infantile paralysis is known also to physicians as Infantile paralysis is known also to physiciana so anerior pationyvillis (police gray, sayolis, marrow—a term applied no doubt when the gray matter was erroncounts appead to be marrow, and tits, inflam mation). So this disease is an inflammation of the anticion horns to the applial court—those parts of the ord which are concerned in muscular movements and evelopment, and such a telon means paralysis, attrophy or degeneration in the particular my nervated from the part of the cord involved

nervated from the part of the cord involved infantile paralysis is generally an acute disease, and by far the greatest sufferers from it are little children from one to five years of age. Apart from the pathos in this circumstance, we would infer ought not, of course conclusively) the in though not, or column conclusively the infectious nature of this form of paralysis. For almost all the scule infections—measies, scarlet fever, whooping cough, and the like—are generally diseases of child hood, adults and the sged seldom contract them, if they have once contracted them in childhood, because the attack in infancy has conferred in most cases, lifelong immunity upon the individual Another rea-son for inferring infectivity in pallomyelitis is its frequently epidemic character, as in the summer of 190' when nearly the whole Atlantic seaboard was ewept, and again in the summer of 1909, when the disease appeared in New York and spread widely throughout

In perhaus two-thirds of the cases that have be studied physicians have concluded them to be infec-tious, though they could not prove this, in the remaining one-third the discase has been attributed to maining one-third the disease has been attributed to falls, to antecedent maturing fevers, and to homo-rhages into the spinal blood vessels. In the light of our present knowledge, however, it is safe to consider that such falls fevers and hemorrhages have not been causative of the pallomyelitis but rather preing factors making the tissues concerned vulner

ing factors making the tissues concerned values able to the essential or specific first.

The motor neurones in this paralysis become smaller, then they degenerate, liquefy, and finally shrivel up, the fibers emanating from them degen shrivel up, the never emanating from them degen crate and airophy. This process may go on to com-pleto destruction of these precious elements, or it may be arrested at any stage. If arrested early, re-pair may ensue and the cells and their fibers regain hairly well their normal condition and function in, unfortunately, the inflammation goes on, the size and shape of the spinal cord at the points involved are contracted and changed, and in consequence of this the muscles concerned become paralyzed, atrophic, and inexpalse of thele; proper function When receivery does lake place these muscles are up to remain small; perhaps throughout lifetime. These little patients suffer also retarded bone growth deformity of the points involved councitimes intered curvature of the property of the contraction of all the symptoms accompanying a fewer; there is a pain to the back and limbs; suddenly these a page of the contraction of the fatrix wall their normal condition and function

supervenes paralysis, generally in the leg muscles. A child may be put to bed seemingly quite healthy, and cand may be put to bed seemingly quite healthy, and may in the early moraling manifest these sufferings. The outlook is generally good as to life their, yet the severity and fatality of the disease, as in all infec-tions, fluctuate widely; and taking it uit nil, pallo-mysiltis is sufficiently diseasens to give medical men much anxiety, as it should give the community

unoral grave concern.

As intimated, the infectious matter of pallomyelitis as been rather assumed than pivoyfit it would now seem that complete domonstration of infectivity will recently be forthogoning. We may then ensertain the confident hope of a preventing the forthogoning when the preventing agent in the property of the preventing agent in the prevention of the preventing agent in the prevention of the prevention

against infantile paralysis akin to that which has practically eliminested smallpor from human experiences. Early in 1806 two German experimentary, Landsteiner and Popper, successfully inoculated two moders with the spinal corest taken from two fatal human cases of pallemyellits. In both the monkeys lasticas of the parallel of the contract of the c of the apinal cord were on autopsy found s

or of 1909 Dr Simon Flexi colleague, Dr Paul A. Lewis, of the Rocksteller Insti-tute, in New York city, obtained the cords of two chil-dren that had unfortunately died of pallomyelitis, in h cords the anterior horns exhibited th teristic grees and microscopic appearances. esthesis inconistion was made in the brain of these similans through a small trephine opening. The in-tected material consisted first of emulsions in sait solution of the two human cords; and later of emul-sions of the spinal cords of the monkeys that had desions of the spinal cords of the monkeys that had de-veloped paralysis after injection of the first emulsion, that from the human cords. The spinal cords in siz-series of monkeys thus inoculated showed without ex-ception lesions similar to those of human pallomysitis

Now a single successful incomistion with human iting in experimental pallomyelitis of establish the scientific case here set forth, because the result might have been due to a transferred toxio body, hat in the experiments of Flexner and Lawis the transfer of the active agency of opidemic infantile paralysis was regularly successful. In one series of seven monkeys the first inoculation was of human virus, the other monkeys were successively inoculated virus, the other monkeys were successively incommet-sach with the virus from the cord or the cortex of f predecessor, the disease regularly resulting. Hench by these and other equally conclusive experiments, or cannot doubt the infectious nature of pallomyelitis.

Again, later injections were made, not only in the brain of monkeys hut also into the abdominal cavity, brain of monkeys but also into the abdominal cavity, the blood vessels, into more substance (as in the sci-atic) of these animals Nor "can it yet be affirmed that still other avenues of infection (as the skin, the organs of respiration or the directive tract) do not evist for the entrance of the viens into the central is system

But now as to the nature of this virus which is re onsible for infantile paraiysis. It is at present in visible under the microscope. Flexner and Lewis after most exhaustive search, have found that it is after most examinative search, have found man it in meither a his terium or a protocon, which parasites have been isolated as pathogenic of most of the in-fections disease. The virus of infantile paralysis— its infecting agent—in of the same nature as that of smallpox, it belongs to the class of the minute and filterable viruses that have thus far not been desunstrated with certainty Newstheless, although the smallpox virus still remains invisible to us, for a com-tury past a veccine has been coviord from it by which we have practically banished this dreadful disease from the fare of the earth, there should then be no reason in science why a vaccine or an immunising agent against pallomyelitis should not now in

By the way, did the reader note in this paper the phrase "after other anosthesia!" It means that the monk-ys suffered no torture during these experiments, so benoficont in their trend for humankind Let us so concoron: In rear trend for numarized Let us congratulate ourselves that infamilie peralysis is an-other added to the long list of draadful diseases for which a remedy is being found through animal ax-perimentation, which could otherwise never have been

An Electro-pnonmatic Conveyor System for Libe

An electro-pneumatic system is used in the Berlin royal library for carrying out the distribution of bo to the readers Upon this system the reader fills out a blank containing the name of the desired book, and upon this blank an employee writes an exact indica-tion of the place where such volume is to be found. The bulletia is then sent by pneumatic tupe to the central office. This office is directly connected by ele-vators with the different stories of the building. These vators with the different stories of the building. These selections are of small sites and are operated selections to of small sites and are operated selections as a push-button system. Besides, there is ranporting persons and books. A set of pasumatic tubes also run from the central office to the different tubes also run from the central office who receives the reader's building sends the same by pasumatic tube to the proper foor, and on this foor the attendants read the shoet and bring the desired books to the slowator which takes them to the control office. This latter effect then easied to the control office. This latter effect then easied to the point from which the building speak in the first place, either in the nature reading room or any other of the rooms of the Bibury.

The production of merviry at the Almaden mines, pain, was 1,017,020 kilos, or \$6,472 findes, to 1904. At tiones it wist \$6,685 kilos.

Scientific American

Correspondence.

THE STRONGER AS A CLOUE.

To the Editor of the SCRIVITY AMERICAN
In regard to Mr. Baker's item in the January lat
number relating to the gyroscope not maintaining its relative to the earth, but relative to a fixed point in space, if this be true, the gyroscope, operated by a small motor and set on a balanced pivot, would ake an excellent timepiece, although slightly diffe en those in present use, make only one rev tion in 24 hours. The clock would of course have to et with the axis north and south, so the gyrosco would (apparently) rotate from west to east. It cou also be geared so as to denote the minutes and se onds, and would be absolutely accurate, with the ex-ception of the slight friction which would have the

effect of slowing the clock a trifle

It occurs to me also that the same principle might be made use of in maintaining the position of astro-nomical telescopes, if the vibration could be overcome, instead of the mechanical, clockwork devices now in

To anyone who has the inclination to experiment in this way, a timepiece of this character would make an interesting toy, and could be very cheapiy con structed. An ordinary toy electric motor should serve an inte the purpose of a gyroscope Edmonton, Alberta. CARL OFSTITUT

WHY DOES A WATCH-SPRING BREAK!

WET DOES A WATUL-BEARN MANAGE.

To the Editor of the Sciphtipis American

Why does a watch apring break after being in use
quite a while? If not strong enough, why did it not

break at the very be Such is the question propounded by the Editors of the Scientific American

Let us suppose a strip of iron to be fastened at one end, the other end being free if we bend it a little and then let it go it will return to its place after viand then let it go it will return to its place after vi-brating a certain length of time. It may do the same again and again, when we bend it more and more until finally after being bent boyond what is called the limit of clasticity, it will be permanently deformed Its molecules have then assumed a difficult position in regard to each other from that they had before

if we keep on bending it still more it will finally reak in two at the point where the strain is greatest or where a defect may exist

or where a defect may exist

Now let us try a good steel spring ilore we find
no deformation appreciable When we bend it be
yond its strength, it snaps at once At least it appears to be so The probability is, however, that a pears to be so The probability is, however, that a permanent bending takes piace first but at a point so near the breaking point that the difference escapes our observation entirely

observation entirely

Passing to the other extreme we will take a strip
of lead. There is then almost no elasticity, a very
slight bending will deform the plees, but on the other
hand, it will lake a considerable amount of bending
or twisting to break it

So much for the immediate effects of bending or otherwise straining any given material But now the question arises, what might be the effort of a strain not quite sufficient to produce an immediate deforma

tion, but sipplied during a long time?

I can give here an example that I have often the occasion to verify Take a piece of tin and a piece of ginc (in sheet) of the same size, bend them to some extent and fasten them Two weeks later release thom The tin will return immediately to its former shape while the zinc will remain bent just as it was

Or take a piece of tar and mut it on the table. It will keep its shape, and even stand quite a pressur-without deformation or breaking down Nevertheless in the course of a few days its molecules will have rielded to such an extent that the piece of tar has not even been able to stand its own weight, and has spread over the table

Now, what has taken place with the sinc or the tar htedly occurs with the other materia certain limits, at least it seems to me so. The piece of iron kept bent near the point of immediate deformation, must in a sufficient time yield and be deformed. tion, must in a summissit time yates and be deformed the watch spring, or other steel spring, kept best not quite amongh to break must in course of time break up. The continued tension of the molecules must have a tendency to displace them, and finally causes them to yield

We have an immense amount of information as to the immediate deformation or breaking of materials of all kinds under stresses applied at once or during a short time, but only very little concerning the effects a short time, but only very little concerning the effects of stresses applied during a long time. Several supposition capbes or bridge steel members have given may after years of service. The general option among singlesors is that the breaking was due to the witness channel for the trevel over the irridge. These fitting channel for the reverse in the capture of the reverse in the capture of t a a crestalline structure instead of the origi-

it is said that a watch spring is more fiable to break during warm than during cold weather I am very much tempted to opestion the correctness of that out

However it may be so to some extent at least in the first place, as a general rule the strength of all metals decreases with an increase of temperature Between the ordinary limits to which a watch is ex Hotween the ordinary limits to which a watch is ex posed, the difference is insignificant. But it is not so as to the expansion of volume. The diamoter of the barrel changes but very little, but the spring, being

carret enanges out very ittie, nut the spring, oving very long, expands out of all proportion in fact the increase of kagth of the spring is about twenty five times the increase of size of the barret That is the equivalent of placing the spring in a smaller barrol and increasing its tonsion and liability of hreakage in proportion

ADMIN GITAL

KROZVIK: TO Knoxviile, Tenn

SAFETY IN MINES. To the Editor of the SCHNTIFIC AMERICAN

in your issue of December 4th, 1909, in an editorial discussion of the Cherry mine disaster you state "the flames reached the dust-covered pine timbers of the structural work" This leads to a suggestion that the arructural work." This leads to a suggestion that the structural work in coal and other mines should not be made up of pine or other timber at all, but of fron or steel Also, from another part of your discussion I conclude that wouldaring shafts should be distinct m the holsting shafts.

In fact, the whole subject of protection to the miners should be studied out by scientific mining experts. The duty to protect the workmen rests as moral duty on the owners and operators of the mines and this moral duty is in need of legal enforcement by approprints statutes State and federal. The man are clearly priate statutes state and federal. The mea are clearly entitled to protection, and protection would in the iong run pay in dollars as well as lives. The whole subject of protection from preventable disastors—and most of them are preventable as in

disastors—and most of them are preventable as in generally discovered after the event—ane da to be made the subject of expert scientific study. The loss of tife and limb due to accidents in mines, in railways and to burning factories theaters school houses and hotels is appallingly great, the more so when much of it, most of it, is clearly preventable. But right here it must be emphasized that too much reliance is had on mechanical signal systems and has links signals on railways and the like No mechanical system can ob-viate the need of emplementary personnal human vigil lance. There must be still the human watchman to supplement the mechanical system. Mechanical sys-tems have their advantages—the advantages of au-tomation. But automatics meets the aid of human intelligence and vigitance. There is no little vature placed on human life the lives of workines, of the placed on human life the lives of workines, of the elers of the appearance at the play, of the children in the great invoked who houses. The man who we must be emphasized that too much reliance is had on evers of the speculators at the play, or the children in the great trowded school houses The man who seem his loved once start on a journey is likely never to see them again, or at best for worst) their charred, almost unidentifiable remains Or it shay live, it is to be maimed, disfigured cripples. Or the man him self may be stricken in his prime—the untimely vic tim of a lack of care or of undervaluation of human Or the president of the railway system -as he happened more than once in the last decade nappened more than once in the last decade—may himself become the victim of bis own neglect and may ride to death in his palatial special The whole matter of accidents is in a condition un

The shole matter of accidents is in a condition unverthy of the intelligence of the country. For one thing, there is lack of contant inspection—eternas in specific, day and light the respection, day and light the properties of the second contains a second contains too much out of consideration, as if they were mere "sports" of Nature, mere chances, whereas they are the certain and inevitable and hence preventable resnits of well known factors—factors of wear and tear. factors of growing structural weakness in timbers and steel, factors of ever possible congruity of unfavorable idental coming together of com circumstances, the in hustible elements etc.

in hotels it must be assumed that fires are likely in hotels it must be assumed that fives are likely tappen at any or all times, and there is need of the eterral vigilance of a sofficient number of trained herizan to keep the whole area of danger under intelligent surveilance. Mechanical appliances should not brogarded as a substitute for these litting impectors but marriy aids. For the automatic system has a hat merely aids. For the antomatic system has a canny, numechanical way of getting "ont of far" at the worst possible time indeed it can be depended on to do this very thing. These observations apply to railways, mines, and factories it is not sufficient to have a jury determine whose negligence caused the positions or to say that it was due to some imperfection in the antomatic signals Prevention is the thing Think what horrible deaths—deaths of scalding, burn-ing, crushing, malming—American men, women, chil-dren and babes are dying aimost hourly The sick-ening scene is familiar—the 'unlooked for accident the sending for the nearest village or town surge the "carting away," the "shoveling up" of the mangied remains, the borrible identification of charred remains hy some jewel or scrap of a shoc or fragment of ap-parel Prevention is the thing through expert sci through expert sci ontific study and adequate justicition. The authorities of enough importance to warrant it being taken up in the great universities and technical schools, so in the great universities and technical schools, so that men could be trained by proper study and prac-tice to take charge of the important work of saving life by preventing accidents it would be a noble and useful work, if achieved—and it can be achieved lializada or railways systems should have a deps ment with a trained corps of meu to cope with the conditions out of which accidents arise. At its he At its bead a competent man, not to operate trains, but to remove the dangers of accidental death sure to arise when all are bent on running the trains on schedule (as now) and no one is thinking particularly of the human fives entrusted to the rallways system, these dangers would be greatly minimized if the right stees are tuken There is a rallway west of the Mississippi Rivor that has been operated for several decades, and it enjoys this unonviable distinction. The road has never caused a single human death i have beard of a steamship line that has never lost a pass ditions were general bow much happier overybody would be ger's life

The depth of the water in the middle of the Berlin Stettii Canal will be a meters 1984 feet), and the breadth at the surface in ordinary soil 33 meters (1882 feet). In soft peary ground it will be from 37 meters to its meters (1214 to 1246 feet). For a distance of 16 miles the bed and benks of the canal will have to be puddled with clay, the surface of the canal there being above the water level of the surrounding country. At one point the canal crosses the valley of the river by an embankment provided with a culvert 160- miters in institut The eleven locks for the descent into the Odor Valley are begun One of them has a fail of 9 meters (2955 feet! The questim of building a lift besides the series of locks has not yet been declared. The 37 canal bridges are all to be built of stoel

CLEARING SNOW FROM RAILWAY TRACKS IN CANADA.

BY FRANK C. PERKINS.

The accompanying illustrations show the construc-tion and operation of a novel cylinder snow plow de-signed and constructed in the Province of Ontario signed and constructed in the Province of control
When the plow of this remarkable machine is forced
Into a drift or cut, the snow is lifted by the shovel,
which is inclined upward and meets the expeller charabers, the snow gliding along until it comes in contact with the expellers the blades of which revolve at a with the expellers the blades of which revolute at a high speed in an upward direction Engaging the snow the bindes throw it neward and outward at a great velocity, delivering it to a distance of 50 or 60 feet on each side of the plow and making a cle

feel on each side of the plow and making a clear or if feet in width and at a speed of 8 to 8 miles p hour in a cut 10 feet deep. The snow is elevated and thrown at so great a cleatance from the track it the possibility of the smallest grant the track in the possibility of the smallest grant the track in the possibility of the smallest grant the previouded. The snow does not onier the experience and the stated that the maximum velocity of the expeller blade at the periphery is 5654 feet

The accompanying litustrations are front and side views of this remarkable cylinder snow plow in one view the snow expellers anow plow in one view the snow expellers are shown in operation, in another a cut 12 feet deep is illustrated. The reader will doubtless not the impression which wedge and aprof. leave on the snow. The thin end profe is only 20 in he shead of the expeller.

Other Illustrations show the cleaned track Other limitations show the cleaned track in a ten foot cut, and the machinery within the plow car, including the boller sleam pipes and engine. The expellers are directly connected with the engine shaft by means of two stoel chain belts

It is stated that each of the steel chain belts driven by the steam engine of this plow is capable of driving the expellers at plow is capanic of criving the expetiers at a moderate speed alone, so that should one belt be disabled the plow would still be able to work at a somewhat lower rate of speed The plow body is of steel construction th

e box portion having the sides envered with wood ifk a box our The roof is of similar construction, which is fire and water proof A door is provided on each side in the middle of the car, the back end being left open for convenience in stoking the boiler A lookout is built at the front and of the car from which

point its engineers can be signalled to
The from and
the car, entirely of steel, has three
chambers, inc two wide once being circular, open at
the front and one side, in which the expellers revolve These are the foot in diameter and three feet six inches wide. Each expoller consists of a cast from hub upon which are formed four spiral fanges, hav-ing a pitch of shout fourties feet Riveted to these flanges are four half not steel plaine or blades twenty iwo inches wide comprising a true heliz upon the hub. The expellers are mounted upon each end of the shaft and overlang the pedestals the shaft ex-tending into the circular chambers. On the middle of the shaft, which is eight inches in diameter, is keyed the aprocket wheel, which is connected with a similar wheel on the shaft of the engine by the steel chains. ese four paris constitute the drive gear The mid die chamber opens in the interior of the car On the ent is constructed the nose of the plou, consisting steel plates projecting forward to the end of the of steel plates projecting forward to the end of the apron or shovel It may be stated that the apron or

shovel is attached to the bottom framing, the side plates, the interior web plates, and the expeller cham-bers, by steel angles and plates. This apron articles forward five feet beyond the center of the expellers. The nose and shovel, being firmly riveted together, present a rigid construction to engage the snow.

This powerful cylindrical snow plow has engines occially constructed. The cylinders are sixteen specially constructed. The cylinders are sixteen inches diameter with eighteen inch stroks and work inches diameter with eighteen inch stroks and work under a steam pressure of 150 pounds per square inch, the maximum speed being two hundred revolutions per minute They are capable of developing 750 I H. P. and are piaced as near as possible to the expellers

But and a second second

A view showing an expeller.

to shorten the drive chain. The engines exhaust into the bottom of the amoke box of the bolier through a sultable nessie similar to locomotive practice, creating a strong blast.

Hardening of Boft B

Mr A. Kubelka of Bushowits in Moraira has discovered a process by means of which the softest sand-sione or limestone can be made hard. The process is the following. First, the surface of the stone must be thoroughly cleaned, so as to expose the pores. Any be thoroughly cleaned, so as to expose the pores. Any oil or grease spots must be removed with bensize or with the alcohol fiame Missing ploces must be filled up with cement mortar, using a 1 7 solution of water-glass for tempering After the stone is thoroughly dry, it is saturated with a solution of potash or sociawaterglass in case of rain during or immediately after this operation, the stone must be again cleaned, dried, and saturated with the solution. Then follows an impregnation with molten chloride of calcium After this impregnation rain will do no more harm as on account of the reaction of the chloride of calcium upon the solution of watergians, the pores of the stone will be filled with insoluble, hard silicate of time, while the soluble silicate of time will be decomposed and washed out by rain Another metho of Kubelka'e is to saturate the stone first with a solu tion of suiphate of alumina, in water, and when

with a solution of potash wakengless. Sensetimes a repetition of this process will be necessary to there excited the first state in a startaste to a death of about \$6\$ inch. State of the state in the state of the present of the state of th

soft atones—cheapness of quarrying and cut-ting—remain, and they can receive after-ward all the prominent qualities of the barder stones.

Mortar and concrete may also be h Mortar and concrete may also be hardened and compacted by these processes, so that they may be used with greator success in works calling for water-lightness, as water works, tanks, street pavements, sidewalks, artificial stone, coment blocks, etc

Monuments can also be protected by thee processes from the influence of the weather

of Removing Hair fr

An article in the Ledertechniache Rund-schau mentions, without describing in de-tail, a new process for the removal of hair from hides, tail, a now process for the rumoval of hair from hides, in which the agents commonly remjored for this purpose (lime, sodium sulphide, etc.) are replaced by rasitable gas, which effects the rumoval of the hair in from two to sight hours. The process is said to be opecially valuable for the preparation of colored isather and fine leather in general, as the product is of very uniform grain and free from the spots which are often processed by ilms and sodium sulphide. The leather is also much closer, foughts, stronger, and reaser is also muce closer, congast, stronger, and more forsible than leather made by the usual methods. Hides treated by the new process may be tanned with bark, astract, or chrome alum. The inventor, whose address may be obtained from the journal quoted, will furnish detailed information to persons interested.

The Coming Aeronautic Show at Bo

The Centing Accountle Show at Beston.

The first Accountle Show to be held in the United
States without connection with any other exhibition,
will open in Mechanics Building, Boston, Mass., on February 16th, and not on the 23rd, as announced in our last issue. This show will remain open one week. So enteen full-sized aeroplanes have already been so rured, and the exhibition promises to be a repres tive one as far as the heavier-in-near machines are concerned The manager can be addressed at 5 Park Square, Boston, by any experimenters having machines

THE REAVERS IN PRESVARY, 1910

iksT among the astronomical discoveries of 1910 is that of a brilliant comet reported from South

At that time it was but five degrees south of the sun, but it degrees south of the sun, but it was so bright that it was visible in full daylight to the nusled sye, and observations of its spectrum, made next day at the lake Observatory, showed the sodium lines bright on a coctinuous proving that the comet was very

This doubtiess means that it was then your Dear

This doubtiess means that it was then you no sun, and strongly heated by its radiation

From the scanty information which is yet avail able it appears that the comet is moving rapidly north-eastward and dininishing in brightness. Its orbit has been computed and ephemeria with be found on page 123 of this issue it is probable that it will be visible for a few weeks in the evening sky, just after sunset. and almost directly above the point where the sun disappears. It is, however, quite possible that it may

lose so much in bright ness, as it retreats from the sun that it will not be very conspicuous. On the other hand, it may be a fine object, and the eve-ning skies will be well worth watching especially about the beginning of uary when moonlight no ionger drowns out faint objects.

Halley's comet is still visible in the evening sky and is very slowly increas-ing in brightness, but it will probably be too faint for the naked eye, though perhaps visible in a field glass.

It will fortunately be easy to locate Just north of the planet Saturn are three stars of the fourth magnitude, in an cast and west line On February 5th the comet will be about 50 min of arc (or, roughly, one and a half times the moon's diameter) north of the middle one of these stars, and on the 17th it will be about the same distance north of the westernmost of th Hy following this three ! line of motion it can easily be found at any

By the end of the month it will be pretty low in the west at sunset, and soon after it will yanjab in the twilight, to reappear, much brighter, in the morning sky in April

While the appearance of these comets is exciting so much interest, a notable advance has been made in

the explanation of these phenomena. Observations of the spectra of the last two bright comets (Daniel s and Morehouses) showed that the light of the tail con sisted almost entirely of bright bands, given ont by some jurninous gas. But at that time no mas was some furninous gas. But at that time no gas was known which gave just those bunds. Very recently Mr Fowler of South Kensington, England, has found that a vacuum tube, centaining small quantities of nitrogen, and of carbon compounds (cardied electrically so as to glow), shows a spectrum exactly like that of the comet's tails, provided the pressure of the gas is made exceedingly small

As the pressure and density of the gas in a comet's tail must be atmost incalculably less than in any vacuum which we can produce by mechanical means, titls gives us a satisfactory explanation of the observa-The luminous particles though so thinly dis tributed th buted through space, are molecules of familiar els has been cleared away

THE HEAVERS
The splendid and familiar winter constellations a

ow seen in all their giory

Due south and about haif way up the sky is Orion The very bright star below him to the left is Sirius. West of this, directly below Orion, are the small groups of the Hare and the Dove. Far below the latter, on or Missouri can see a star of except This is Canopus, the principal star of the great con stellation Argo, and, next to Sirius, the brightest in the beavens. This star's brightness might make us the beavens. This star's brightness might make we anticipate that, like Siriue, it might be a near neight bor of ours in space, but repeated and careful observations show that this is not so its distance is too great to measure accurately, but it is at teast ten times as far off as Sirius, and probably much farther times as far of as Sirius, and probably much farther from us. Canopus must therefore be really a most magnificent iuminary, exceeding our sun at least a thousand fold in brightness.

To the left of Orion and Taurus are Canis Mis To the left of Orlon and Taurus are Canis Minor and Gemini, and right overhead is Aurus, with the bright star Capella. In the southwest there is noth ing of much interest, but in the west we see two bright objects, one above the other, not marked on the map These are the planets, Mara and Saturn, whose motion among the stars makes it impossible to put them in our permanent make of the heavens Mars is higher

up than Sature, and is redder in color

in the northwest we see Andromeda and Casslopeia, and above them Perseus. This is another of the con-stellations which bears no real resemblance to any-

thing in particular, but with the aid of the drawing in our initial it is possible to see how the ancients found here the figure of the here carrying the head of the Gorgon Meduas, which is marked by the bright star Aigol

star Algol
The bright spot in the Milky Way, between Perseus
and Cassiopeis, is a spiendid star cluster, showing well
in the smallest telescopes.
To see how the northern constellations appear in

To see how the northern constallations appear in the sky, we must turn our map spatied down, so that the words "Northern Horizon" are at the botton. It will then appear that Cuphens to below the Pois, on the left. The Littie Hear hangs by its tail from the sight and only his tail showing. The Great Bear is climbing up the heavens to the seatured, and as laredy high in the east in Lon, pretty well up, and above is Cancer, with the star cleater Prassage. Firs-ther to the right is Hydra—an immessee constriction, whose head is already high while its tail will con-tinue to drag their live shall for three hown league.

Mercury is morning star throughout the me is unfavorably placed south of the sun. He may be best seen about the 20th, when he rises about 5-46 A. M. Venus is evening star until the 12th, when she passes between us and the sun and becomes a morning star. At the beginning of the mouth she is easily wishin in the avening, setting more than an have said a bid later than the sun, and at its end she is similarly conone in the morning skies.

During the middle of February she will be invisible to the naked eye, but as sha passes almost 8 degree north of the sun, she should be observable talescop-cally, in full daylight, as a thin crescent, all through

Mars is evening star in Aries, remaining in sight 1111 n

till nearly midnight.

Jupiler is in Virgo, rising about 19 30 P M, at the
beginning of the month, and 8 30 at its close.

Satura is evening star in Floreon, setting about 10
P M in the middle of the month.

Uranus rises only about 1½ hours before the sun,
and is nunbservable.

Neptune is in Gennini, observable all the avening,
but only with a good-stast tenscope.

THE MOON

Last quarter occurs at 6 A. M on the 2nd, new moon at 8. P M on the 9th, first quarter at 10 P M on the
17th, and full moon at 8 P M on the 23rd. The moon 17th, and full moon at 3 P M on the 23rd. The moon is nearest us on the 12th, and farthest away on the 28th. She is in conjunction with Urahus and Mercury on the 7th Venus on the 9th, Saturn on the

13th, Mars on the 15th, Neptune on the 20th, and Jupiter on the 27th Princeton University Ob-

servatory

The Library of the Amy-

During the interval of the past fifty years twenty the past nity years twenty thousand stone tablets, ap-proximately, of the library of the Assyrian king, Sardanapalus, were found the course of excavat nd in among the ruins of Nine veh and taken to London The texts written on them, which are related to one another apparently, are now published in their original cuneiform script by the British Museum In serial collections Varions have therefore an oppos innity for further investi n of the texts their special province, for avery kind of text in cuneiform script presents its to the translator and com to the translator and com mentator In the four-teenth collection, or vol-ums of the work are as-sembled those tablets of the kings library which regard chiefly the objects of the three natural king doms. Obviously many of these lists were prepared for purposes of marine

For this reason a prom-inent physician, Baron Oefele, assisted by noted

scholars in cunciform cript among them Prof Einmern of Leipzig, began to examine this collection with a degree of seal that has become quite prolific. Apart from the many lists which mention minerals, the numerous lists of animals are mostly of a uniform kind The names of animals are arranged in two collumns, the same names being are arranged in two columns, the same names being given in the first column in Sumerian and in the sec-oud column in Accadian, that is, in Habylonian 18111 far more interesting than its soological lists are the botanical lists, of which there is a given number, and botanical lists, of which there is a great number, and which give the most various directions to exquain the aspiring physician with the effect and use of hundreds of medicinal plants. This fact may suffer to be about that among the old Rabyinosians the knowledge of the natural sciences were already for greater than among their successors, the Greeks and Romans, whose names of atminist and plants, it is markined, here been de-rived partly from the Babyinosian language.

MRTHOD OF BOSNOWIELDS GAS. BY A J JARNAS

How to economies the consumution of gas for Humi-

tow to economise the consumption of gas for illuming and heating purposes is a question of consider the price charged for cost gas at the present time in many towns and cities

SECTION OF THE GAS

many towns and cities is so high as to prevent its use for coc' 'ng pur poses. Only b exercis-ing the utmost econ omy in using only just enough to rook the small quantity of food required does the use of gas for cooking become advantageous undor such conditions. By means of a simple

apparatus the heating qualities of the gas can be improved so as to reduce cooking ex penses and the cost of lighting as well, for in

Welsbach and kindred lamps it is the heat of the hurning gas that renders the mantle brilliantly incandescent Moreover the lamps it is the heat of the hursing gas that renders the mattle brilliantly incandescent Moreover the sighting qualities of the gas are gravily innuvered as the highling qualities of the gas are gravily innuvered as the highling the property of the property of the property of the season of the s

cylinder C six and a half in hes long and three and cylinder C six and a haif to hee long and three and on-haif inches diameter is soldered all round to the cone top of the cylinder A and is provided with a sper-forance bottom control to allow the hydrocarbon with which the economier is to be thereof to run through and saturate the rottom wanta D The cylinder C acts as a spreader, causing the year which enters by way of both the control of the cylinder is an expension of the cylinder is and both by the quantum the property of the cylinder is and con-trol the cylinder is an expension of the cylinder is and out through spice P The apparatus is charged with bounder, granificer or a similar, valsitic before each out through pipe F The apparatus is charged with bensine, gosoline, or a similar volatile hydrocarbon bensine, gasoline, or a similar volatile hydrocarbon capable of being taken up by the nonlinuminating con sittuents of coal gas, such as hydrogen, marsh gas or carbonic oxide At G is a suitable brass stop-cock which enables one to turn off the gas when charging

A 100-LIBER AND A 10-LIBER GAS BOODORIEER

the apparatus with gasoline. The brass cap at B much have a filth of pillable leather fitted in the interior to that it becomes periodicy gas-tight when accreted during the meaning the secondary to make a hole in the supply type B at B as that in case the gasoline should cover the bettern of the birdy type this would prevent any fishering of the birdy type this would prevent any fishering of the light A to building of the gas through the light A.

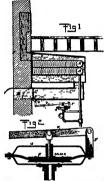

The charging of the apparatus must be carried out in daylight, and it should be fitted near a window where daylight is admitted, for a lighted match, candle or lamp must not be used. With these simple present into the prefetty and the cope too must be perfectly soldered where the incrination meats, and all the brane connections attached to the intet and outlet pipes must also be perfectly soldered indis rubber pipins or consectors must not observed in the contract of the co ordinary naked burner will be vastly improved
It has been found that half a gallon of benzine will

take the place of 500 cubic feet for direct illumination in this apparatus

The cotton waste in the economizer must be packed The cotion waste in the economizer must be packed moderately tight. If packed too loose it will slak and give less surface for the gas to reach the gasoline. Bo sure and mark the outer end of the inlet pipe 1N. This will prevent any mistake when installing the

REGULATOR FOR INDIRECT AND DIRECT-INDIRECT STRAW REATING BY B A JORD

Every indirect and direct indirect steam heater should have some kind of a regulator so as to shut off the air supply when there is no heat in the radiator, otherwise, especially at night when the steam pres-sure goes down and the air box remains open with the

REGULATOR FOR INDIRECT STEAM MEATING

old wind blowing directly into it, it will soon rool off

The accompanying lijustrations show a very simple way to make such a regulator Fig 1 shows the gen eral arrangement of an indirect heating radiator, and Fig 2 shows in detail the regulator

The radiator A is inclosed in a box in the usual way taking its air from the outside through the passage B and having a sbutter or damper C mounted to turn in suitable bearings on a shaft. The latter has a small bell crank D secured to its outer end which through a bell crank P secured to its outer and when turvens we link is connected to a levoy E. The lever E is plotted in suitable brackets P fastened to the regulator G. The regulator can be made of two small frying pans or skillets say about 5 inches in diameter. A part of the conical rim is bent outward forming flanges for boiling the same together. The bending is done very easily. Place the skillet over the edge of an iron block, and with a fint peen hammer attreth the edge, say about \$\frac{1}{2}\$ in the peen hammer attreth the edge, say about \$\frac{1}{2}\$ inch all around To the lower head, rivet a small floor fange, which will herve for counsetion with the atsamptive from the bolier in the center of the upper head a hole in made large amount to receive a hair lach nipple. To the lever in fantened a

ceive a haif inch nipple. To the lever is fratened a short red which passes down through this nipple to the dispirings H.

The dispirings H and of after rubber, say 3/16 inch thick with one or more layers of duck in it. To the top and bottom disks of from with heavied each state of the layer of the paper disk is soldered a haif inch hipple or pleer of pipe, serving as guide. The whole is now pieced between the two beads of the regardate and haif discrete very relationship To the lower head in factored the usual siphon pipe to prevent the statem from onlying the regardate of the prevent the statem from onlying the regardate of the statem from onlying the regardate.

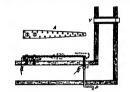

to prevent the steam from entering the regulator. As the steam pressure rises it will force the diaphragm

upward, thereby opening the shutter C in the air passage B, permitting the cold air to pass under and through the bank of radiators, thereby heating them there up through the registor into the room and will these up through the registor into the room and will keep it open until the sleam pressure goes down. The weight of the arm E will then close the shutter por mitting no more sir to pass until sgain opened by the steam pressure. A weight may be attached to this lever, so as to close the shutter more effectually

THERMOSTATIC ALARM FOR HOUSE HEATERS

The accompanying diagram shows how a simple tarm for house heaters can be made

The object of this siarm is to give warning whou the farmace is overheated and needs attention, or when the fire is nearly out and needs more cost. A there static bar A 11/2 inches by 1/16-inch is made

THERMOSTATIC ALARM FOR HOUSE HEATERS

and from rivered logselber very closely and fastined at one end are branches if which nor secured to a suitable base H. The free one of the har A movre between two contact points in made of ordinary accretelyer. There are acressed into posits i' made of ½ linch dowel and secured to the base H. The whole is fastiened in an inverted position over the times of the prize where there is danger of the internation of other place where there is danger of con-tecting After the contact points are adjusted to close the circuit at the proper temperature title; are con-nected up to an electric bell and interty as indicated in the drawing and iron riveted logother very closely and fastened at

in the drawing

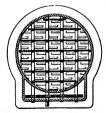

A switch is placed in the circuit at some convenient A switch is placed in the circuit at some convenient point. It will now be seen that when the thermosistic bar B moves to either side, according to the tempers ture and makes connections with coninci points D the bell E will ring When the apparatus gives the necessary starm the switch must be turned off until the trouble is remedied

ADAPTING A SEATS FOR SEALL COAL.

BY 1 A SEASON

The graies in the ordinary bouse hosting furnaces
are regulated and made for the best and most suitable
sits of roas in to be used in each particular case. That
is to say in a large localer farmace where age coal is
not sailable, a very cames and open grate is previded but to a smaller formace where smaller coal be
to be used, a must be formate.

in some localities where pea coal is much cheaper than egg stove or nut it would perhaps be more eco-nomical to hurn the pea coal provided the grate would permit. As a rule, if the pta coal is used in these large furnaces it has not proved very successful on account of the coarse grate, unless a new one is put in more suitable for the smaller coal as the shaking of

SPATE ADAPTED FOR BURNING SWALL COAL

the old grate will cause the whole fire to dump into the

To overcome this the writer has tried several meth-

To overcome us to writer our rived sweet incur-ods and has come to the conclusion that the best is that shown in the accompanying illustration. The grate is an ordinary rocking finger grate. Be-tween every or every other finger (which will do und upon the kind of grate and also of the size of cost to

There should slways be a layer of an inch or two f ashes on any grate Care should be taken not to shake the grate too much, as a great deal of live coal will fall through and sometimes start to burn in the

ash pit thereby warping and destroying the grate bars.

The writer has used some old pipes and grate bars for a number of years and to-day they are as good as new Some years ago, during the coal famine, a great deal of bituminous coal was burned with perfect success it is but when starting a new fire to clean out the ash pit and if any live coals fall through they may be showled up on the fire again until enough are formed to prevent them from falling through

HOW TO BURN COAL ECONOMICALLY ST W B ALLE

The accompanying illustrations show how in a very simple way the gases in an ordinary furnace may be simple way the gases in an ordinary furnace may be consumed and burned thereby giving off a more uni-form heat and maintaining an even temperature throughout the house continuously night and day it will effect a saving on the coal bin and produce more

ited besides

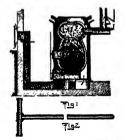

The fire in a stove or fernace is simply the result
of a chemical union of the carbon properties of the
fire i both solid and gaseous, with the exygen of the

ily the complete combustion of one pound of coal 14,600 heat units are given off, but by the incomplete combustion of one pound of coal, as burned in the great majority of domestic heaters, only about 4,000 to 5,000 heat units are produced and the balance of the to hoo heat mits are produced and the balance of the hoat passess away up the chimney a rich combustible gas that should have burned

To obtain the highest efficiency from coal it must be hurned with the icast possible supply of air con sistent with perfect combustion, as an excess of air carries the heat of the fuel lute the chimney and a certain mixture of air from below the grate will cauan explosion in the smoke pipe blowing the fire door open and filling the cellar with spirit gases. Nearly every furnace discharges so-called "coal gas

which is due either to poor draft or a defective fur nare, or an improper adjustment of the dampers. As the odor is so noticeable, the difficulty is soon reme died Every furnace hewever, is constantly discharg feetly odoriess and is a very energetic potson, as the it of imperfect count suit of imperfect combustion
Ordinarily the domestic user of coal reasts out the

Orannerity the dampers and drives it up the chimney gas, mens the dampers and drives it up the chimney and then proceeds to burn the coke, which is only shout one-half of the it at value of the cost, besides it is not alone the heat that escapes up the chimney, but the rich combustible gas that passes away uncon sumed. This gas when burned produces a uniformly

ARRANGEMENT FOR BURNING THE GASES OF THE

higher temperature than the coal liself, which may burk at varying temperatures even so low as to produes but little heat

The elinkers that form in the furnace are the result

of an excessive draft below the grate

To accomplish the mixing of the hot gases and air

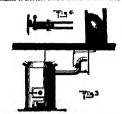

the air must be heated to the same tomperature.

The most common domestic heating furnace is the bot-air furnace. This is simply an improved stors in-closed in a sheet iron or brick casing. The furnace eats the air within this inclosure to a high ten

tin pipes. To keep this current of hot air rising, a tin pipes. To keep this current of hot air rising, a "cold-air box" connects the lower part of the turnace with the outside air and is regulated with a damper This cold-air box should always be kept open as much an possible and nerve entirely closed while there is fire in the furnace, as the furnace will become overof and may be injured.

neated and may be injured.

Fig 1 shows how the common hot-air furnace may be adapted to burn the gas of the coal A small pipe, any 1 inch or 1/g inch is inserted through the upper part of the smoke pipe (as the gases here are the hot-cet), torminating in close proximity to the smoke collar just inside of the radiator of the store. The inner end may be fitted with a suitable spreader, such as shown in detail in Fig 2. The cross pipes have a number of 3/16-inch holes drilled in the lower side, or

faring downward. The outer end of the pipe is fitted with some kind of a damper to regulate the supply of the come kind of a damper to regulate the supply to be comes bested and at its delivery end is of the same temperature as the passed, but as the specific gravity of this bested kir is much greater than that of the same compared to the same of the same compared to the same to the foresterned in the foresterned the compared to the same that of the same to the foresterned into the burn with a blood fine, but as in an ordinary gas about the same process of the cesting phonomer

in order to make the system a success the fire pot must be in perfect condition, that is to say, in a hot sir furnace there should be no communication between sir furnace there should be no communication between the fire pot and the air chamber, no crusk and no loose joints. The fire door should be as air-tight as possible. This may be made tight in the following manner. First, fits and remove all rout at the edge of the door until in notalitic surface appears, then are a narrow strip of assession and soak in sail water, after with placet is around the door and it will salers? Fur s litle oil on the door frame and close the door The nebestos will then fill up any opening and bake very hard on the door

if everything below the grate were absolutely air tight no combustion would take place, but as all furtight no compution would take place, but as an revenue last more or less this leakage is enough to support combustion in ordinary weather. In extremely cold weather, however, the silde in the sah pit door may be opened a little, so as to furnish a little more alr

A damper is attached to the smoke pipe above the air pipe, so that when open it will not cool off the air

A fire is built in the furnace the ordinary way, keen the air damper closed until a good fire is obtained than put on some coal and keep the lower damper open for a few minutes, after which close all drafts and open the air damper, regulate the same according to the heat required, that is to say, more heat, more to the heat required, that is to say, more heat, more air "Through the before-mentioned mics window ob-serve the results. All the gases in the furnace will, however, not hurn, as some are bound to escape up

consumed

There is more economy in running a large, slifter all day long than a hot one at intervals. The fore it is best to cosi the first twice a day, in the moting and at night, and regulate it so that the fire bur with an oven temperature. It will keep the house at

with an oven temperature. It will keep the house at a uniform temperature night and day.
When the furusce has been cooled for the day or the night the dampers may be controlled from any room above by simply relating or lowering a lever com-ned with winner ranking over pulloys to the various dampers, thereby savings many a step. This is above in Fig. 2, a sectional plan of the levers is above in in Fig. 2, a sectional plan of the levers is above in

Fig 4 in ordinary weather the fire should only be shaken once a day, preferably in the meresing, but in very mild weather twice a week will suffice. Only shake until the first red coal comme down. In furnaces with very strong drafts shake but very little, as the layer of ashee on top of the grate will help check the draft. If the fire is very low stick a few phones of kindling

wood into the fire. This will heat up the submissiple. The sub-pit door may also be opened until the file is drawn up, then regulate as before described. With this arrangement in good working order over

particle of coal will burn to an ash. oal, of course, will not burn.

This applies to all three heating syst

use, namely, hot air, hot water, and steam, as it only takes care of the fire.

takes care of the firs.

In botair heating, in addition to regulating the fir
the cold-air hox must be regulated. This box genera
ly terminates outside the building under a porch,
has always been a source of annoyance because
changes in the direction of the wind. Sometimes ti changes in the direction of the wind. Sometimes the wind will hole directly into it and cool off the house, hut when the wind is in another direction it will made the hot air out form the furnace into its atmosphere. To overcome this a shield is placed in front of the box, gay 8 tendes from the hulding, overlapping and 12 to 18 tuckes all around. Then it will be impossible for the wind to interfere with the regulation of the air, which is generally done in the ceillar with a damper or shutter

or shutter

The pipes in the cellar leading to the registers about be kept clean, also the registers Areld public ting any wire useful so catch articles dropped thereon, as it will catch more dirt than anything also, sometimes clogging up to mension completely, forming an excellent breeding place for bacteris.

The water pan should be connected with the water supply, controlled by a fient valve. This incurse an over water level in the hurtaxe.

In steam beating plants the boiler and radiators In steam besting plants the boller and redistores should be large enough to keep the bause at a temperature of 70 day in zero weather with one possible of the part of 70 day in zero weather with one possible of the part of 70 days and the part of 70 days are done on the best better that redistors are done on the part of 70 days are done on the part of 70 days and poor the next, despite favorable winds, the fault is with the chimmey it should be built lighter This is a great

deal cheaper and better than to put an unsightly

HOME-WADE AND SIFTER. 27 F A 26

A dustless ash sifer can be made at a very small expenditure of money by following the lites of the accumpanty of swelly Make a bor A shaped as shown about 2 feet high 2 feet long, and 10 inches high at its lowest part. The box should be of such a width as to fit a square hole in a base board 2 Make the base board such as shown as the same of the same board of the same and out a square hole in the base board of a such as also set to be a such as the same of the same and the same an

A problem seld blacted trucks. So far they

have Raided to develop any services afficial
tion, It tooft the utmost patience of the

bary to a state which he now considers

practically "not-proof" Naturally the

public has not been so patient and has

been granulining about the long delay in

jubile has not been so patient and has been granking about the long delay in developing the bettery concerning which or much has been promised. The other day the public was invited to import a street railway car equipped to import a street railway car equipped to a short section of the bettery has been delay to the ordinary car not only in the power source, but in soveral design free amount of current to be stored in the bettery in thirt of, and in order to make this power go as far as possible it was essential that importance weight be eliminated. The question of weight is not so vital a manurer received as great deal or a stantion. Mr Raiph A. Beach, who has been Mr Raiph A. Beach, who has been sufficient in adapting the storage battery to traction, was called upon to build a special car that would be as light as possible He found that the common street car is merchy a smaller and alightly as possible He found that the common street car is merely a smaller and slightly modified steam railroad car, and it was necessary for him to branch out on en-tirely new lines. He guarded as jealously against unnecessary weight as the builder of an aeroplane The backbone of the car he avoived consists of two 18-foot lattice girders which extand the entire length of the body under the ser's They consist of electrically welded steel bars and are so inflexible that when loaded with two so inflatible that when loaded with two tons at the center they show a deflection of but \$71000 of an inch Around these two girders the car is built in the first place they form a casing to receive the batteries of which there are 210 calls, 100-cm each side for power and 10 for light-las Aall the superstructure of the ear is built of wenter and light woodwork with the exception of the strap rails and posts, which are of bicycle tubing and act posts, which are or ocycic tubing and act as a framework to support the weight of the roof. The roof itself consists of a single sheet of veneer bent to the proper form, and is so light as to permit of making the side posts much smaller than in the ordinary car. The fact that this car does not have to authors a troller

car does not have to support a trolley pole has allowed of using so light a roof. pole has allowed of using so light a roof.

The truck contains many novel features. The connection between the truck and body is such as to permit of a side and end movement of but 1/4 of an inch, and end movement of hat M, of an insh, and an anthough it may more vertically to a much greater degree. The object of this is to insure smooth running and to prevent the usual swaying. In place of the usual car whese light steel whesis are used. The arise are divided at the center, being connected by long sheers which parmit one wheel to gain upon its must when rounding curves or it case of a slight difference in their diameter. In the arrangement will be seen the influence of the automobile. There are other features are well which remind one of the automobile and show a radical departure from the common car construo-

the automobile and show a radical de-parture from the common car construc-tion. In place of gearing the motors directly to the wheels a silent chaft drive in used which, as automobile practice has abown, furnishes a more economical transmission owing to the fact that a large part of the sprocket wheels is in mest with the chain, whereas in the apur with the chain, whereas in the spur gear transmission only one tooth, or at most, three teeth of the pinion, can heaging the teeth of the gear. Furthermore, the chain drive parmits of a greater gear reduc-tion. Commenty at to I reduction is the most used on railway cars, whereas on to 1 is employed. This permits of us

was adopted.
The our is equipped with two become power 110-rolt motors which are; of a very light construction. During the bound tasks the pix matriants of matrials.

> ARTIFICIAL PRODUCTION OF THE VOICE. (Concluded from page 120) emitted by the larynx were recorded by a phonograph The following conclusion

were reached

When the larynx of a dog is remo during chloroform anaethesis, the lar during chloroform anaethesia, the lar yngcal muscles retain their ability to con tract for a short period, which varies from 3 to 10 minutes, but no contraction can be produced in the muscles of a dead even if it is removed immediately the arterial blood has escaped the arterial blood has escaped in order to produce the vibrations the current of air should be impailed by a pressure of from 6 to 8 inches of water as it is in the normal production of the hu In these conditions the excleed larynx of the dog barks and howis in every note of the canine register from the deep baying of a mastiff to the shrill plpe of a torrier. These various notes are obtained at will by causing various muscles to contract. If the stimulation is confined to the muscles which connect baying of a mastiff to the shrill a terrier These various notes the two aryteneld cartilages (two small cartilages at the back of the larynx to cartinges at the back of the laryax to which the posterior ends of the vocal cords are attached) these cartilages ap-proach esch other and a deep tone is produced if on the other hand, the stimulation is extended to the muscles which connect the arytenoid cartilages with the thyroid (artilage (the large shaped cartilage at the front of the lar which the anterior ends of the vocal turds are attached) the vocal cords are contracted and a high, shrlll note re

The pitch of the note appears to be in depend at of the pressure of the air and the strength of the electric current, and to be determined solely by the part of to be determined sololy by the part of the muscular system of the larynx to which the stimulation is applied. The whole larynx, including the gloitle and the epiglottis, changes its form with every change in pitch Hence the larynx is a musical instrument which produce various notes by changing its form and

These experiments, in addition to their urely scientific interest, explain the dden loss of voice to which singers and public speakers are often subject. The loss of voice has nothing to do with the vocal cords, but is caused by a sudden contraction of some of the muscles which control the glottis and is analogous the rheumatic and neuralgic cains which

to Conclude from page 123.)

he is very completely represented by throught specimens showing the three distinct styles, that he adopted in the course of the descripment of his art. His first dishes were usually oval in form, decorated in the center and at art. His first dishes were usually o'us form, seconded in the center and at the other with a sure of the comment of the center with a sure of the center with the center of the center o h an illustration is here pres and he modeled in miniature sculpture and afterward colored and enameled a very diversified series of small articles. e, hardy-gurdy and bagpipe players

We produce berwith a portrait of Bor-ndrd Palisay from an oid Prench min-ature of his period on vellum, that is oreerved at the Cluny Museum Palisay is represented, full face and in court co-tume with ruffs. His doublet is embroid-ered and relieved with gold, the sleeves are be-ribboned, and on the chest is braid ve the head appears the inscription

Anove the need appears the inscription

His works roffect slike genius and
artistic taste, and his work was original,
marvelously true to nature in execution
and coloring, and probably in a more
marked degree than any other master of marked degree than any other masser or the ceramic art, he learned to perfect colors that would be, after firing known quantities, a knowledge that enabled him to duplicate, with such wonderful cer-tainty, the color offects of the fish, reptainty, the color effects of the fish, rep-tiles, insects, etc., he loved to reproduce The extent to which his style was imi-tated affords the most practical proof of the favor it enjoyed

Hartford Fire Insurance

With the coming of 1910, THE HARTFORD FIRE INSURANCE COMPANY has rounded out a century of busness history. That means something in the hazardous business of fire insustance, for four out of every five companies organized in this country have either failed or retired. It means unshaken stability. The smoke of every great American confligation has darkened the sky over the Hartford's head. In San Francisco alone it paul ten millions. But emerging triumphant from the ordeals of 100 years, it enters it is recond century stronger than ever

millions. But emerging triumphant from the ordeats of IUU years, it enters its second century stronger than ever Unshaken stability for a century is no mean heritage, but age is venerable only when adorned with honor. Honor implies more than honesty it is the quality which impels an institution to meet every obligation, not only with promptness and exactness, but with past, its aim today, and its ideal for the future. Its policies afford pass, in suit today, and its locat on the luttle.

In policies and unsurpassed indemnity, and by co-operating with its patrons to lesser fire dangers, it offers continuous service. Its business, scattered among more than 15,000 communities throughout this great land, is the largest of any fire insurance company in America. Its agests are everywhere.

CANADA AND THE QUEBEC BRIDGE.

NGINERING and are historium works of tifirst magnitude are to no little degree au
expression in contrete form of the character
of the people by whom they are built it
would be difficult to define the extent to whith our impressions of the smilent tirrek are based upon the mrchitecture of his unbie shrines and temples or how far uur respect for the later Roman is due to feats of engineering skill that would do credit to our twen unitaxilivi

Because of the skill and daring which are or seem to be involved the design and erection of bridges of summand magnitude has ever been considered une of the most difficult, we had almost said spectacular feats of construction and the successful creetion of such elevatures has brought world wide famo to the and distinct national credit to the in which the work was done. Thus the Forth ilridge in which the work was don. Thus the First littles stands to-day as one of the noblest mountenies of constructive engineering in the whole of the tittlish cupitre, and a memorial to the man who was responsible for the design has recently been placed in Westmin rter Abbey So too ou Bruoklyn Bridge over So too our own beautiful and diguified ridge over the East River is a lasting tribute to bridge engineering as initividualized in America and the city of Trenton has recently un-velled a monument to the memory of Roebling the

velicd a musument to the neumory of Robbling the lather of long span sups union bridges. But that selfsame notoriety which brings internal tomal faune to the man and the people who carry great engineering works to a successful issue must, in the very nature of things throw a proportionate shadow of discredit when one of these great struc-tures falls in utter ruin and, as in the case of the tures falls in utter ruin and, as in the case of the Queba Bridge carries migh upon one hundred souls to destruction. This fact was frankly recognized at the lime by the capture ring and to built all press both in this country and in Canada, and it was realized to be a matter of national importance that when the bridge came to be rebuilt, the new structure not only be perfectly stiff and strong but that it ild embody soch architectural frontment as wor render it esthetically pleasing to the eye, and worthy of that great school of bridge engineering which has sprung up and fluurished in the Western Hemisphore

When the Canadish government took hold of the matter and lent all its powerful prestige and financial sesistance to the scheme, it was accepted as an nugury that the new bridge would be wurthy of the great Dominion across the border line. We have to confus Dominion across the border line we have to contrast box ver that the bridge which it is now proposed to build its decidedly disappointing. The type selected and the method of treatment are not up to the latest standards of bridge engineering in other words the design is distinctly commonplace. Æsthetically it bas not a single redeeming feature

in redesigning the bridge, the Canadian government could have made more sure of securing the best pos-sible designs, if they had thrown the bridge open to some designs, it they had throw he arrays open to world-side romposition. We should then have learned whether the atrongest, most economical and most beautiful brilings tould have been secured under the cantillevir or inhier the suspension system of design. It requires the suspension system of design. ld be possible to produce a suspension bridge would be greatly superior to the structure which it is ros proposed to build. The suspension bridge espe-cially when built of those great proportions is a far-asic bridge to creek not being subjected to those heavy erection stresses which are the peril of large cantilever erection. Moreover, the ossential elements namely the amborages the towers and the main cables are at all times entirely free from suspicion, and may be erected with the absolute certainty that they are well within the limits of safe construction. With these main elements assured, it is possible for failures to occur in subordinate elements, such ag the suspenders and stiffening trusses, without in the least endangering the integrity of the bridge as a whold.

Not so, however, the cantilever bridge, the gree part of whose intricate framework is in compression. Let but one among the multitudinous members of the main trusses fail, and the whole structure will be thrown into immediate and absolute ruln the mass of tangled steel now lying in the St Law

rence River

For the recdit of the profession of bridge engineering in the New World, for the prestige of the great
and growing people of Canada, and above all for the
creater safety of the public at large, we trust that,
before the final plans of this great bridge are adopted the Canadian government will take steps to make it coriain that the final bridge will, from every point of view—ongineering, architectural, and artistic noblest work of its kind yet erected in any co

CAUSES OF THE PARIS FLOOD

HERE appears to be a consensus of opinion muong the French scknists that the causes of the recent phenomenal rise of the Belne when it reached the record height of 31 feet 2 inches, are to be found more in geological than in interorological conditions. The basin of the Seine and the streams that are tributary to that river consists of a light absorbent sell, and, as the slopes are gentle around In winter when the soil is either frozen or enturated by the rains, there is a risk that the run-off of a heavy precipitation will be so large and audden as to overtax the canacity of the river channels. These conditions obtained to a marked degree during the re-cent continuous heavy rainfall and flood. Member the reologist is of the opinion that the heavy rains pre-ceding the flood found the soil of the Seine watershed so thoroughly impermeable because of saturation that the unter ran off as swiftly as it would from the surfe the unter ran off as swiftly as it would from the surface of an asphalted or comented street. Furthermore, it seems to be generally agreed that the denudation of the forests in the higher regions of the watershed has been a contributory cause to the fixed Not only do the trees assist evaporation but the furest undergrowth also assist evaporation but the farest undergrowth also exerts a material influence in retarding the flow of

Referring again to the question of the prevention of future fixeds at Paris regarding which we made editorial comment last week, there is an alternative plan to that uf dredging or widening the channel and no that ut dreaging or which, were it not for the coormons expense involved would afford an absolute coornous expense involved would afror an absonute safegnard against future diseaser. We refer to the herole measures employed by the Austrian ongineer to prevent the fooding of the city of Vienna by the river Danube. This consisted in cutting an artificial this consider in countries are the city through which, after the river reaches a certain elevation all the surplus waters are diverted and discharged into the river waters are diverted and disagreed into the river-below the (if) It would be possible to create a sim-ilar by man around the (ity of Paris, but the cost due to the great value of the land which would have to be condemned would probably be found to be probiblitie

WATER CONSUDERATION IN MEW YORK STATE

FFER about three years of investigation of the subject of water resources, the State Water Supply Commission estimates that 1 500,000 horse power of water energy is run ning to waste every year in the State of New York and that if this were developed according to plans drawn up by its ongineers the State would realise a vestly rental of at least \$15,000,000

a result of its investigation of the watersheds of the Hudson, Genesee, and Raquette rivers the Comtion has located and surveyed four reservoir pr jects for the development of water power and the control of floods. These are the Sacandaga and Schroon Lake reservoirs on the Hudson, the Portage received on the Genesee, and the Tupper Lake reservoir on the Genesee, and the Tupper Lake reservoir on the Requeste The Commission considers that the Hudson River, bocause of its size and the large population and important industries of the cities attended along its banks, should receive the first consideration. nated along its banks, should receive the next emission cration in any system of conservation that may be adopted, and it recommends the construction at a voint on the Sacandaga River, 50 miles north of Albany of a dam and storage reservoir of 25 billion is feet enpacity. Such a dam would convert 20 es of the present river valley into an artificial lake

miles of the present river valley into an artificial labe of the since of Lake George The principal object of this reservoir would be noted back and since the flood waters, and afford re-iled during the low-water conditions of the summer to the various power plants about the Hudson. by releasing sufficient water to maintain the level of the river at the desired stage for operation of the Parisualle plants. In addition to the great benefits abrorded by much control of the stage of the river

water, the power developed diffectly in connection with the big dam would be transmitted electrically to such towar as a library. Trot, Mechanicaritis, Ginan Palis, Utilez, Schenectary, and other less important com-munities typing within the sone of economical electrical transmission. It is estimated that the reservoir would transmission. It is saturated that the reservoir would cost \$4,650,800, that the total yearly fixed charges and maintenance would amount to \$227,700, and the annual gross earnings \$427,600, leaving an estimated annual net revenue to the State of \$189,800. The commission estimates that on this basis the cost of the reservoir would be refunded to the State in fifty years at the end of which time it would be the sole owner of the works, which would yield a perpetual income from the saie of the stored up water

income from the sale of the stored up water.

The Commission advises that the work be undertaken by the State, because under State control the necessary funds can be provided more economically, and the interests of the public can be absolutely safeand the interests of the public can be absolutely sare-guarded it recommends the enactment of a law au-thorising the development of the power of the Hud-son River, the construction of a storage dam on the Bacandagn at Conkingyille, the amendment of the Constitution to permit the flooding of State lands constitution to permit the flooding of State lands in building storage reservoirs to be owned by the State, another amendment providing for a bond laste to meet the expense of building reservoirs, and the huilding of other reservoirs to requisite the flow of rivers for power purposes and flood control

STEEL BELTS.

N Germany steel belts are used in many large N Germany steel belts are used its many large factories and electric power stations. The principal difficulty connected with their employment is that of joining the ends of the belt. Three-ends are now provided by the makers with steel plates which need simply to be served together. It is necessary to use alread of special quality and temper it is not another than the steel of the provided by the material content of the server can define the server content of the server can be served by the server can be served by the server can be served by the server can be served to the server can be served by the server can be server can vas, to which thin silves of cork are attached in order to prevent slipping. The cork lasts practically forever and reduces the sliding to less than one tenth per cent and requires the sitting to less than one tentil per con-or the travel Prof. Kammerer has experimented with a sleet strap, two-fifths inch wido and one-fittleth inch lick, with two wheels, either feet in diameter for the transmission of 16 horse-power with a tension of 400 pounds. Although the wheels were not covered, they worked very silentity even at a speed of 200 feet per second. The maximum slipping was one per cent of the travel and the loss of energy due to this cause was inapproclable

Steel belts possess the following advantages Steel beits possess the following advantages: The energy is transmitted without slipping and almost althout loss, the beits do not stretch their width may be reduced to between one-third and one tenth of that of leather beits transmitting the same power, that or teather bette transmitting the same power, consequently the wheels may be uncrower and lighter and the workshop less darkened by them. The steel betts do not deteriorate appreciably they may be used in damin places and du not appear to be attacked by amoke or acid. They sllow the attninment of velocianoke or acid. They sllow the attnimment of veloci-ties of 100 feet per sevend and are counsequently very autable for use with turnines. The required tension is one-tenth less than that of leather beits transmitting the same power, because of the difference in weight the same power, because or the directors in weight from whith results an additional economy, owing to the diminished friction on the bearings. Math room can be saved by using steel belie because their effi-tion; does not depend upon their length. They can be used horizontally in place of gearing. The makers sesert that they cost less than isather belts of good cuality

quality
The oldest steel belts have been in service two years.
In a Berlin factory a leather belt 24 inches wide was
uplaced by a steel belt 4 inches wide which transnits about 250 horse-power. The belt, after two years
use, shows an indication of wear. The only objection
to steel belts is that they are not easily seen, and consequently may cause scelefent 31 they are not caresequently may cause scelefent 31 they are not care-

A remarkable phanomenon was observed during a thunder shower in Finland in the animum of 1908 by V. J Laine, who was making meteorological observathunder shower in Fininada in the annurer of 1998 by . J. Lains, who was making metocological observations for the Finnish scientific society. The shower approached from the east and the thunder, which had approached from the east and the thunder, which had some and the same an

THOMETHING.

According to a recigit dispatch, a contract, for the construction, at a cost of \$400,000, of a dam; which will form part of an irrigation scheme in the seathern section of the island of Porto Rico, has been swelless to naive engineers, who secured the award in gompation with four american firms. The total cost of the scheme is \$25,000,000.

The heaviest rainfall ever recorded for a single day on the linkinus of Panama occurred during the great Scood of least Documber, between the heurs of 10 A. M Documber 38th and 10 A. M Documber 39th, want hair gage at Porto Bello showed a fall of 10.88t inches. The total fall for the month was 58 17 inches, which is equal to an average rate of nearly two inches a day

The steen frame, radder, and brackets for the new White Star lines "Olympic," which were recently suppiled by the Darlington Forge Company, are the beaviest errer cast for a steenably. Their total weight is 339 tons, made up as follows Stern frame, 70 tons, after boss arms, 74 tons, forward boss arms, 64 tons, and radder, 100 tons The total weight of the same parts as cast for the "SatureStant" was 130 tons.

The rapid elimination of the saling vessel is shown by statistic result; given by a German paper in the twenty years between 1888 and 1986 the percentage of saling vessels has declined in the merchant marine of Great Britain from 441 to 114, of Germany, from 84, to 131, of the United States, from early, the contract of the contract

According to the French paper Matin, the Minister of Martins is saking of the construction of two dread-nongists of 33,000 tons such in a programma which has complete of 33,000 tons such in a programma which has examined the arminister of the same consistency of the sam

The hoomester recently built for the electric operation of trains through the Cascade tunnel of the GRAT Hortzern Railway, where the electrical continues are tends for about six miles, welfas about 120 tends are tends for about six miles, welfas about 120 tends are tends for about six miles, welfas about 120 tends are working on a 500-voil; affected circuit. The pressure on the line is 4,000 voils, which is reduced by trainformare carried on the boomoutive. The power part, which is driven by water power, has sufficient capacity for the operation of sixty miles of the line

The Public Service Commission has recently adopted an order requiring the New York Subray operating company to install on all subvay cars destinating company to install on all subvay cars destination signs, similar to those now used on none of the are of such train. The company must also post in all stations, near the citect office, a map aboving the locations, of its routes and the streets intersecting the subvay likes; and all stations must be equipped with illuminated signs, placed on the subvay valle, for the former of the subvay valle, for the former of the subvay valle, for the former of the subvay valle, for the subvay valle, for the subvay valle, for the subvay valle proposed where the subvay valle for the subvay valle proposed where the subvay valle for the subvay valle proposed where the subvay valle for the subvay valle proposed where the subvay valle for the subvay v

B is olesmed that the lighthouse establishment of the United States government is the most compared and efficient in the world On June 50th, 1999, the service included no test than 1,651 lighthouse service included no test than 1,651 lighthouse perers; and during the dread year of 1910, 81 additional lighths, requiring the services of 47 keepers, with the stabilishment of three additional lighthouse district, convering Alaska, Forto Rec and the marst station at Canastamano, and the Hawalian Islands. The cost of the establishment list year was \$5,57,000.

the establishment last year was \$5,557,000. Ba a roosed communication to a New York paper, Mr Hodson Maxim shows the futility of stampting to work any serious destruction by the dropping of dynamite from a flying machine. He states that the destruction effected would be very much less than anyons not acquainted with the action of high explosives would suppose; and that many tons of dynamic might be explosed in the middle of Midsion Square without only more serious damages than the showing out of the windows of adjacent bettings by the runh of air windows of adjacent bettings by the runh of air forward the explacion to full the void formed by the

wents suppose; and that many tons of dynamic might be exploded in the middle of Mallacen Square without any more serious damages than the showing out of the windows of sudgested belieflings by the runh of air toward the explosion to fill the wold formed by the property of the suppose to the suppose of the

ELECTRICITY.

Less than a year ago the New York Public Bervice Commission of the Second District Issued an order limiting the number of passengers that could be carried on each car of the Pine Rills line in Albany Therê was so much public dissatisfaction with this restriction that the order has recently been withdrawn.

Are report on the the and yels commytten in 1906 at report on the the and yels commytten in 1906 total number of ties purchased by electric railways for the year was (455,586, of which 458,1196 were here and the rest sawed. A large majority of the ties were onch, the number being 2,614,600, chastant comes second with 1,488,138, while Southern pine and codar follow with 144,600 and 800,687 respectively. The unmber of poles benught by electric railways and electric light and power companies was 231,647, which is considerably jority of the poles were redar, viz., 285,689, chestant comes second with 186,050

In piece of the ordinary windmill type of tower whitharto used for transmission lines, a new form of tower is now beginning to find favor. It consists of two columns aspect a short distance apart and con nected by horizontal members. The plane of the lower is transverse to the direction of the line, and at its upper out it supports a cross arm on which the transmission lines are supported. The advantage of the mission lines are supported The advantage of the construction over the rigid windmill type is the fact that in case of a break in the line each lower would give somewhat and distribute the strain, thus prevent ing the towers from being pulled over one after the

The Illacds traction system covers a territory is unlies wife and 155 miles long. But he new work is being done along the lines of this system which requires the general measure to make frequent trips from place to place. To prevent less of time he has da a elooper and office car hull, it which he can conduct heatness while are route and which he can conduct heatness while are route and which will carry him over night from one point to another. The manager's car is well equipped with all the convonience that he might feature on his trip. It is provided in the forward part with an office room so arranged that it can be convexed his a beforeon with four berths separately curtained off. In addition to this there is a dising room and kitchen. The over-sell length of the

In the recent report of the Royal Commission or Cansis and Inside Navigation of the Bullet Kintolou, the following conclusions are reached on the question of electric bullety on cansis, analy; that a greater regularity and antiformity of speed may be unintained, that there will be fase received of the canal basks from waves, that there will be an economy in the size of the locks because the storage capacity of barges is not laken up with propolling machinery as in tups and steamboats, and that the electric power can be utilised from the control of the control of the conlong tags of providing for horse and electric hautage aloby a risk, but this proved to be in-specialbacuse the electric traction was constantly retarded by the slower bross-frawe boats.

One of the axibitie at the recent Unicage Electrical Blow, which attracted considerable attention, was the government seroplane fitted with a wireless tolegraph receiving and sending system. The chief difficulty in fitting up an seroplane for wireless tolegraphy lice in the fact that it is strung with wires used for bracing the parts and these interfere with the reveption of the message on the short autenna wallable on such a machine. The difficulty was overcome by stringing throw streams of No. It copper wis solony the under surface streams of No. It copper wis solony the under surface attacks of No. It copper wis solony the under surface at 100 pc with the surface of the

A serial proposition was presented before the recent meeting of the American Institute of Silectric Binghineers by Frof. W 8 Franklin and Mr 8 8. Septent. They propose to reduce the length of single-poseseries motors, so that motors of higher horse-power can be accommodated in the space between the drivers of a loomnotive. The reduction of length is edected by using a stationary senterior amenture and a revolving field and removing the consultator on an arrowants point. The communitator would be stationary and the brushes would have to be revited about they connection with the field This would provide type of motor should be stronger than the field, and would smalls a better utilization of the space ordmarrily occupied by the communitator The advantages of shaving the communitator accessible and constants; of having the communitator accessible and constants; of having the communitator successible and constants; of having the communitator successible and constants; of

Prof. Frank H. Enowiton of the U S Geo Survey, has just published in the Smithsonian Miscel laneous Collections a short paper entitled. Descriptions of Fossii Plants from the Mesozoic and Cenezoic The paper includes descriptions of North America." of two new fossil chain-ferns, the first of which called Woodwardia maroni, was found in the Fort linion formation near Rock Springs, Wyuming It is of special inforest from the fact that it is very closely re-lated to the common chain form so widely distributed over eastern North America from Nova Scotis to On tarlo and Michigan, and south to Fiorida Louisiana, and Arkansas. The other new species which he names Woodwardia columbians is from the Pleistocene and was found at the Cascades of the Columbia River In Oregon It, likewise, resembles closely a living spe-cies originally described from Mexico, but also found in Guatemala Arisona, California, and Washington Prof Knowiton also describes a Dennstaedita ameri come, which is characteristic of the Fort Uniou forms thus, never having been found outside of it. This fern has its closest affinity with a living species found wide-ly spread over China. Japan, tropleal Asia, Polynesia and Madagascar These three new ferms were found in excellent condition, showing the fructification, and are of special interest on account of their close resemblance to forms now living a very unusual experience with fossii nlanta

NOVEL AMERICAN MONOPLANE

The monopiane illustrated herewith The monoplane illustrated herewith to one of the most novel aerol lanes which has thus far been produced. It is the invention of Mr. A. L. Pätrner who for some time past has been as sociated with Mr. Grean H. Curtiss in the eroduction of his servicianes

This new monoplane while resemb ling the Curties by land in some the usual tyre is a distinct depicture from the usual tyre of shigh surface machine such as produced abroad by Bicciot and the Antoin tie Company Unilke the machines there is no square r triangular body extending the length of the muchine and carrying a iength of the machine and carrying a jair of wings near its front end in lace of this there is a single plane mounted upon four vertical wood strots at its center and having a fixed horizonial hall 10 feet at the rear and a single surface horizontal rudder 14 the ed in front just above and at the entr of the horizontal rudder Both judders are therefore always within the view of the aviator. They are ontrolled by a single whell laced scritcally in frost of the aviator. This which sign or crates sliding panels on the under side of the monoplane at each end for the purpose of mate taining the transverse stability. The ated by a single wheel makes this ma thine the simplest to drive of any

thus far produced

The plane has a spread of 30 feet and a fore and all width of 6 feet The plane levelf is but 31 fe t z 6 feet quivalent to an area of 180 square
for the silding wing tips are can
by fort by for from front to rear
The holizontal rudder is 6 x 3 fort in not not broaten rudder 1 feet in size and the vertical rudder 1 feet long by 2 feet high The dimensions of the tail surface are 6 x 2 feet 1 he total w ight of the machine the lanks being filled with 6 gallons of gasoline and 1 gallon of oil and the radiator

SMOKELESS POWDER-METHOD OF MANUFACTURE.-- II.

BY ROBERT G SKERRETT

In the issue of the SCHTTLITC AMERICAN OF February Etch it was shown how greatly the Improvements in the power of navil guas are due to the introduction and development of smokeless powder. The present articles is develote to the description of its manufacture. The base of our smokeless powder is cellulous—that womerful shad yet indescribable form of matter. Cot to its one type of pure cellulous—that in the Present of the control of the

In 1833 Bracomot discovered that starch dissolved in nitric acid and when cleaned in water became an intense explosive. A little later Pelouse obtained the same results by sosking cotton fabrics in that acid

The nitrating house is like a great, gloomy steam laundry the cotton being digested in centrifugal wringers like those in which (lothes are washed

and then washing them in water This was the first step in the evolution of sunchained powder. Because of the great violate and serrate behavior of the explosive than discovered it took years to develop it into a sile propellant. More than fail a country ago at a sele propellant. More than fail a country ago at a serie of the property curbon of the country of the property curbon and as series of as tidents and unex pecied explosions caused its abandonment Years later when the speedy topped box and the rapid for grant arrived. For each chumbin through stress of need found ways to check the explosive violence of gun found ways to check the explosive violence of gun

cotton and to fashion it into a safe and practical propellant. We followed France but our powder has been the immediate offspring of that produced by the great Russian chemist Mendeleff

reservations common sentences. The continues of the same and these videous corrections that common groupswise had been videous corrections that common groupswise had been videous and more neutry. The secret discovered by the chemists proved nitrocellulous to be some his to the influences of deterprets agents with a suddenness of explosion while the form of the mainter precision in a remarkable way the rapidity with which the granules here and gravaria the previous continues and proposed by the previous continues of the previous continues and gravaria the previous continues and proposed to the previous continues and gravaria the previous continues and proposed to the previous continues and previous the continues and the mustal velocity of the shot forms that the conditions imposed by each cellber of gau cast be met and halps grave late to the previous continues and the mustal velocity of the shot regulated with autoniability previous continues the previous continues and the state of the ordenness and the mustal velocity of the shot forms that the conditions are the state of the previous continues and the previous continues and the state of the previous continues and the same continues and the previous continues and the

Now for the manner in which harmless cotton is transformed into a ballistic agent at the Naval Pow deer Pactory Indian Head Md No official service are betrayed because the value of the process lies in the other proportionists of the various ingredients combined with particular forms of grains. These niceless are the outcome of lessons learned after much expermenting in which the variation of a tiny fraction of as inch may either make or may the nordest

menting in which the variation of a tiny fraction of as high gradient of a since any elicity make or mar the product. Oction when steeped in nitric acid becomes soluble in a mixture of other and alcohol if the preventage of nitration be less than 1276 and is insoluble when the measure of acid is above this arbitrary dividing line. When below this percentage on intract cotton which by nitration becomes an applicative—may be disabled by nitration becomes an applicative—may be disabled to the state of the second of th

dividing line of those substances soluble in other sleekei

The ' pyre?' is piled into open tube, and transport to etenming tanks, where it is betted and belied to extract the major part of the clinging setd.

Ennaing the finic pulp through the "wet-machine," whence it comes from the reliefs in finked containing about 40 per cent

the of the resolution of hydrollers in which the "pyres" is unless with the otherwise had solventy and environment take "our petit," before pressing it take solid

the dehydrating house, where all but a very small percentage of the motheties is extracted by pressure and finally by the use of alcohol to drive the dampiness before it and leaves enough of the spiritis behind to form the needful solvent.

In the drying house, where the powder grains are stored away and dried to the proper sings, before testing and scaling away in alreations tanks.

NOT SESSEED FOUNDED IN MARTINGTURES.

A WAY OUT OF THE MARINE TURBINE DILLEMMA.

Provided that it can be run at the high speed as which is faul deficiency can be assured, the steam tur hine is the most evenoulcal of all steam on the most evenoulcal of all steam on the most evenoulcal of all steam on the high speed of rolation can be employed, since a type of generator may be coupled on that is austhalia to that speed. When the steam turbine is employed to drive the propellers of a steamability, it is no longer possible to run it at the best speed for economy, and this for hersams that the propellers at the outward end of the turbine shall shows it is own best efficiency at speeds of rotation for lower than those demanded by the turbine. If we run the shall at the maximum-efficiency at the propeller is the run the shall at the maximum-efficiency after of the propeller. If we run the shall at the maximum-efficiency appeal of the propeller, there will be low efficiency in the turbine.

Here as have a diffemma which the marine engineer has hitherto found it impossible to avoid Rt be astempted to cut the Gordian knot by a compromise, and has tried to find a mean speed of rotation (too siew for the tribine, too fast for the propeller) which would give the best or rather the least bad results on the 'rook per hours' basis.

the "could be solved by a continued by a period by a collection of the problem. He has been seen to be precised that the relution of the problem line in the selection of one see such that problem, and see far back as 1904, in a report to Green Westinghouse, George W. Meltille, the termer Euriner in Chief of the Navy, and Mr. Lohn II Marchigher, made the following statement: If one cruid device a means of reconciling, in a practical manner, the necessary light paped or revolution required by an efficient propeller, the problem would be solved, and the turbine with the comparatively low rate of revolution required by an efficient propeller, the proposition of ships. The solution of this turbine with the comparatively low rate of revolution required part of the proposition of the proposition of the proposition of the proposition of the problem would be solved, and the turbine week proposition of ships. The solution of this problem would be a sixthe of great against

10 the Intervaling years three entirely different methods have been desired for meeting the difficulty One is to install high-speed turbo-speciation, and utilize the current to drive alow speed motors direct-connected to the propoler shaft and experimental work in this direct hos has given such good results that the Fore River Bhighshilding Company re-ently put in a bill for the equipment of eur 2000-ten battleships with an installation of his character; in another synthem of the company of the c

It was no easy task to devise a gearing which would us monoibly and withest excessive wear at the high speeds required for steam turbines, and at the same time transmit the thousands of horse-power per devised by projeller shafts, which amounts in the case of the Wauvetanis' to about 18,000 horse-power per shaft. The experimental gear which is lituatized on the form large of the issue was constructed at the West-front jace of this issue was constructed at the West-front jace of the issue was constructed at the West-front jace of the issue was constructed at the West-front jace of the issue was constructed at the West-front jace of the issue was constructed at the West-front jace of the issue was the form the property of the interest of the interest of the construction of the property of

As will be seen from the illustrations, the garan are holical that is to say, they do not run straight across the face of the wheel parallel to the axis, as in the case of ordinary apur gears, but they are cut in the form of a stee pipiral. This constraint allows the wheels in roll into contact without shock or jar. Of course, this helital form of tools cause a strong sed through the properties of the sakes, and in throat in the direction of the axis of the shake, and in order to prevent this, me-half of the gase was cut the prevent that the opposite direction and the other way the end throat. One to dilutily of the teeth, is commissive halanced.

In spite of the marvelous accuracy with which the teach of gears can be cut by modern machinery, it is impossible to form them so truly and align the shate so perfectly as I get an absolutely uniform contact throughout the entire length of the gear. This is an important consideration in all gears, but becomes doubly so when, as in this case, they may have to transmit from tan to twenty thousand horse-power The inventors have met the difficulty by a very in-

The inventors have met the difficulty by a very significan construction designated as a feeting frame, which they describe as follows: "The frame which carries the bearings for the piston is a heavy steel casting supported only at a single point midway because the state of the piston, and the frame is free to escillate in a vertical place passing through the sait of the piston, but is held security against motion in any other direction. Purchasenes, Any tendancy of the test he bear harder at one and of the gar tann the other would tend to nublakenes the state of the sait of the piston cannot present any resistance to unbilanced on thirty, it constantly adjusts itself in the direction of its axis to escent any resistance to unbilanced on threst, it constantly adjusts itself in the direction of its axis to expective process. This means that the tooth contact researces are always automatically equalized. "If there are any minute irregularities in the opening of the teeth, which would tend to make the contact of the teeth which would tend to make the contact of the teeth which would tend to make the contact of the teeth which would tend to make the contact of the teeth, which would tend to make the contact of the teeth, which would tend to make the contact of the teeth, which would tend to make the contact of the teeth, which would tend to the tendent of the tendent o

"If there are any minute irregularities in the spacing of the both, which would lead to make the contact harder at one point than another in any part of the revolution this tendency is defeated by the footing regularity of the control of the control of the control of fair turn is controlled solely by the pressures of the seath of the pittion against the tent of the large gear Naturalty, the footing frame always yields under the sulphest tendency of an unbalanced contact pressure, in such a way as to transfer the smallest increment of unbalancing pressure to another section of the gear that, in the absence of the footing frame, would be seen inclined to take its full share of the stress In short, the gears are self-adjusting to relieve and equaties all showerns at trains, and are consequently independent of the small inaccuracies that are impossible to collinate in the best commercial manufacturing operciminate in the best commercial manufacturing oper-

The ener was tested by means of a special hydraulic brake, the roduction gare bing interposed between the turbine and the brake, and in six test the brake herebyeard editivened by the gare at different speeds varied from 3,712 to 5,327. Since there is no way in which to measure the indicated horse-power of a steam turbine, it was necessary to establish the exact brake horse-power in some other way. Fortunately, it is a characteristic of the steam turbino that, as long as the speed and exhaust pressure are maintained contant, the absolute inlet pressure of commercialty dry steam is a very accurate measure of the brake horse-power the turbine is at every accurate measure of the brake horse-power the turbine is a very accurate measure of the brake horse-power the turbine is a very accurate measure of the brake horse-power the turbine is a very accurate measure of turbine is all, was subsett, of the state of speed, a constant vaccum was maintained in the exhaust plue, and the inster pressure accretepoding to different loads at this speed were determined From these tests the following results were obtained.

B. II P delivered by goar	B. H P of turbine as determined from in- let press, etc.	Ricioner	
3,713	3,771	98.7	
4,156	4,197	99 0	
4,576	4,622	98.9	
5,036	5.108	98.7	
5,486	5,567	98.5	
5,927	6,057	98 7	

A reliable check upon these results is afforded by the rise in temperature of the duth which the gave is lubricated since the transmission loss in the sparse is bettered and notice the same papera as heat in the oil 13 measuring the quantity of oil circulated and noting its rise in temperature, a close approximation to the number of British thermal units lost per hour is obtainable. When the spar was edivering £0.88 horse-power, 519 nounds of oil were circulated, with an average rise in tamperature of 28 days. For much the fitted was the total heat absorbed per hour was 164,268 British thermal nutts absorbed per hour was 164,268 British thermal nutts absorbed per hour was 164,268 British thermal nutts with the state of the sequivalent of a house-power, the total heat accounted for including the state of the product of the sequivalent of a house-power, the total heat accounted for including the sequivalent of the

reason With these results before him, Mr Westinghouse has made as investigation of the ecopessies with could be secured by applying the gast to the Onnerders "Meatr-tanis" and "Lustianis," which are safe-shable of evologing 70,000 here-power if the mans high est-cinary can be secured on board slip) as has been element of the secure of t

probably dose set empirity. If per cept, if so, the solval offsetive propelling juvice is only about \$83,00 horses proven. At the investigation provides mentioning from the use of the reducition grant, propelliers could be stalled that would have an efficiency of not less than 85 per cent; which means that the shack horse-power required for the same effective propelling power would be less than \$17.00-m serving of about 15 per cent. The per cent of the per c

equipment and the coal consumption on such voyage about one-servant to this economy at the propoller and of the shaft, there would be corresponding and even greater occomies realized at the trethics. For it is will understood that the equal solicionies in any treatments of the second solicionies in any treatment of the second solicionies and treatment the respective peripheral meeds of the rotating sisments. But the peripheral speed of the rotating sisments in the turbines of the "Manvistania" and "Lesitania" is only one-third of the speed common to large turbines used on land. This would make that to obtain the sificiencies common to the inter, the "Manvistania" turbines would require approximately aliatimes as many rows of blades, which would make as machine of prohibitive length To maintain the same speed of revolution and increases the peripheral speed of the turbines to that of turbines in land practice, the

of the turbines to that of turbines in land species, the rotors would have to be nearly of test in diameter. Now, the steam consumption of the turbines of the Valarenania is believed to be about 14.5 pounds per shart horse-power per hour; but it has been proved that in turbines of suittler capacity, operating at speeds which the reduction gear makes possible for marries of the contract of the co

te the eargo capacity.

But there are further commontes, as will be seen by reference to the illustrations on our front page, which show the space occupied by the present turbus equipment of the "Mauretania" and that uncommany it mail high-placed torbines combined with reduction generates a supplying the common of the property of th

comment a unnecessary and result result from the example. All the advantages on unresheat stansars would be realised also on naval vassels, together with other collateral advantages due to the fact that the high-speed turbins would not suffer the large drop in soon on which results, in the case of the present turbins, when they are operating at cruting appends. With the superier stams encouncy of the high-speed turbins the holder capacity would be reduced fully method, and with the same bunker capacity the radius of action would of rourse be enormountly increased—a consideration of the state of t

The Current Surplement.

Among the big things which the big State of Coul. formal professes are estimated. These hirds are discussed by C. F. Holder. Mendelt have and the origin of species are openiarly desumed by Prof. Out. With. Herbert. A. Humphrey writes on an internal combustion penus and other applications of a new principle. His aim has been to produce a pump of more simplicity and strength of constitution, in which the explosive force is exerted directly upon the setter, and in which no rotating givenies, one plants for an expensive to the setter, and in which no rotating givenies, one plants are to expensive the setter of the control type of pumps, which have been set to the setter of the control type of pumps, which have been set to the setter of the control type of pumps, which have been set to the setter of the setter of the setter of the control type of pumps, which have been set to the setter of the setter of

THE PAIR "ALL-MI-607" SUTP.

To the Editor of the Scurstruc Aurences
In glanding over your issue of November 20th, I was
In glanding over your issue of November 20th, I was
truck by your correspondent's interesting articles, "A
Dreadmought of 1852" However, done it not seem
more logical to go back a year earlier to Extension's
"Monitor," which was without doubt the first "all bidgan" slip hulli. The "Reaches" was really a combination of the "Mortimer" and the "Monitor" being
the house and the property of the combine of the "Mortimer" and the "Monitor" being nation of the "Morrimac" and the "Monitor" being like her antagonist, a rand frigate, and resembling the "Monitor" in the matter of her turrets, therefore, it appears that the "Monitor" was the original dread-nought, and the present mighty vessels of that class are but the design of the great Swedish American saare not the design or the great swedish American en-gineer applied to occargoing vessels. For be it known that Ericason nover intended to employ the "Monitor" vessels for any other than coast defense duty Brooklyn, N Y Grande Ellis Chonin

SIGRTING A RIPLE.

To the Editor of the Scientistic Amer

I was interested in Mr Woodland's article "Sighting a Rifle," in your January 22nd laste, and I would ilke to mention a point which I think he has over-icoked, viz., the immp of the rifle This term refers a angle through which the barrel receits while to the angie through which the barrel receits while the projectile is traversing the barrel in off hand shooting, the ride receits upward, and sometimes stightly sideways about a center which is probably a little forward of the hutt plate. The correction for this should be applied to both sights, and directly pro-portional to their distances from the center of recoil, but as the rear sight is very near this center, and has little vertical movement due to the jump, it is su ittle vertical movement due to the jump, it is sum cleant to storate the front olght through this angle (This is done by the manufacturer, notice the high front sight of a six shooter which always has a con siderable jump) Mr Woodland's plan was ordently to make the correction on the rear sight only, and while this would keep the front aight lower, and would correct the dagle of jump, it still introduces a constant vertical error at all ranges—an error equal to the vertical movement of the front sight the la small, and perhaps negligible for the 0 22 call bers, it would still affect his calculations slightly The builds would strike a little high, tending to intersect the line of sight bearer in the saccading hranch and farther in the descending hranch of the trajectory Chappaqua N Y A. W BEELL

CURIOUS PACTS ABOUT SQUARES AND GUBES.

To the Editor of the Scirwittic Amenican
I have discovered the following curious facts about
aguares and cubes. These facts, in my opinion, are
interesting from a selentific point of viow besides beneg of some practical use I shall be very glad to
have you publish them If you doesn them of sufficient worth.

1 To be a square a number must have for its unit's digit one of the digits 0, 1, 4, 5, 6 or 9 This, irse, is well known but I put it down as an aid in understanding the other facts.

- in understanding the other facts.

 2 To be a square a number, if its unit's digit be
 9, 1, 4, 5, or 9, must have for its ten's digit 0, 2, 4, 6,
 or 8, 1 a, the ten's digit must be zero or an even
 number It the unit's digit be 6 the ten's digit must number If the unit's digit he '6 the ten's digit must be 1, 5, 7, or 5 is, an old number If the unit's digit he 5 the final digits of the number must be 08, 255, 6085, or 685 If the units digit he 6, there must be an even number of zeros at the end of the numbers. 3 A number, to be a square, must have as meand-der whan "nines are cast out" of it either 0, 1, 4, or 7 the same remainder when dirided by 8, as when the num-sums remainder when dirided by 8, as when the num-
- same remainder when divided by 9, as when the num-per in divided by 9, this test is easily applied by divid-ing the sum of the digits of the number to be tested by 9. To this test I can give an algebraic proof 4. A number, to be a cube, must have as remain-fer when "lines are cast out" other 0, 1, or 8. This fact also I can prove by means of algebra. I can furnish you with a device, if you dealer it, by

I can furnish you with a device, it you desire it, ay means of which, the squares of the numbers 1 to 25 being given, the squares can be written off in order of itôtium without any multiplications

MIM PECK AND MRS. WORKMAN.

To the Editor of the Scientific AMERICAN cent of the lower north peak of Mount Huascaran in Peru in 1908, Miss A Peck wrote in Harper's Magazine and in other periodicals and papers the following

regarded as certain that Huascaran is "it may no regarong as certain that Hussevaran is above 23,000 feet, hence higher than Anonesque, 23 800 feet, and the lottiest mountain known on this hemis phere If, as seems probable, the holight is 24 000 feet, I have the hour of hreaking the world's record for mon as well as women." Knowing from her own statement that Miss Peck made no instrumental observations above 19,600 feet on Husscaran, and belloving, furthermore, Aconcagua on Hamcaran, and bollowing, Turthormore, aconcagua to be the bighest mountain of the Andes, I decided to test the truth of these assertions by sending supert European engineers to make a detailed, up-to-data trilation of the two summits of Mount Hunscaran

anguation of the two summits of Mount Husseafan.
The only previous known measurement of this
mountain was made many years ago, whith is said to
have given a height of 22 180 feet for the south or

have given a height of 22180 feet for the nouth or higher ensmit.

Prof. 8chrader, who a few years ago made the most subbentle measurement yet made of Atonesqua and M Honri Vallot, both well known Fronth selections and heads of the Societies Generals of Kinder of the de Tra varx Topographiques of Paris undertook to assist in setting any thou compelline, and says the matter their

lose personal attention

M de Larminat, expert engineer who has carried m de (Arminat, expert engineer who has carried out important survey work for the above socialty was scienced as chief of the mission in July 1909 ac companied by two other competent topographers, he started for Peru

Favored by good weather conditions and assisted a to transport by the Peruvian government they executed a careful and detailed survey from the sea to Ynngay and by actual measurement established the ineights of four stations in the Black Cordillers, from each of which they triangulated the two peaks Huascaran, so that Huascaran now stands as one of the most accurately measured high Andean moun-

The results are Height of north peak climbed by Miss Peck, 21,812 feet, of south peak still unclimbed, 22 187 feet These figures may vary by a few feet but not many when the calculations are finally gone over by M Vallot for verification

Mount Aconcagua nearly 22,900 feet, still remains, as I predicted and as Sir Martin Conway and other Andean explorers have always maintained, the highest peak of South America

Miss Pork's highest awant to date therefor stands peak Huascaran 21812 feet instead of 24 000 feet, as she estimated it, and she has not the "honor of breaking the world's record," elther for men or women, for my two highest ascents of respectively 22 568 and 23,300 feet debar her from that honor in the case of women while a number of men have made ascents exceeding her highest

THE LOWE OBSERVATORY ON ECHO MOUNTAIN, CALI-FORNIA. U. S. A.

BY EDGAR LUCIEN LARKIN, DIRECTOR

Do you want to imagina that you can almost near the earth in its turolog? No word printed on paper can convey to the mind of a reader this impressive siloner above the clouds. When Beho Mountain is allone above the clouds When Scho Mountale is within a heavy cloud the darkness is that of night From sunset until dawn when clouds are excessively dense the jet black solitude is indeed welfd. The mind is sixway profoundly impressed and imagina-tion is vivid and siert. In the midst of this quietnds and darkness lights are suddenly turned on by a dis tant finnt. Night turns to day. Huge masses of met and darkness light turns to day. Huge masses of met has and wires in a dynamo in Los Angeles, in rapid olution, cause the light to flash out on the moun tain top. The observatory is on a sharp peak between two immense canyons, deep and wide. The mouths of these chasins cut in herculcan rocks are blacker

midnight than the imagination can conceive.

Who knows the meaning of the word there. None in able to understand what ejear means if fiving in a valley liters on Echo Mountain the atmosphere is so clear that the stars seem near enough to fouch, and the mountain air wonderfully pure glow with a brilliancy all unknown to those living any whore near was level. At all times, wave immediately after copious rains the dust envelope aurrounding the earth is visible beneath

it covers the ensea. To us on the mountain top it seems of times as if every humon would thoka in this layer of dust. Above us at night, buge diamonds, Arcturus and Spica likewise, and above all the glaot star un Canopus, gittering distant south fashing its rays over myr lade of wave crests tossing in the Pacific Ocean the brightest star in the relestial vault, cannot be New York The magnifi cent constellations of Orion, Herenies and the ful that words are powerless to describe the is astonishing to behold the apparent nearness of the galaxy Monntain perspective the purity of the air and freedom from water vapor during Iwo-thirds of the year com-

the snound of the moun

to form au ontical illusion At times this decenapproaches a night mirage, and c tive influence approaches a night mirage, and one scenar to be walking among the very stars. Here we was the many and the withing hour is at smoot a sunset of orange and flower indeer plains and watery waster beyond. Round and about the winter solution the walker disk may be seen standing on the sea. Soon half of the might sphere only is visible. The last view is comparable to an are light. Then only no the first magnitude sizes are seen flashing between distant peaks. Be

stars are seen maning between distant peans. Be-fore the last gleam of the sun has vanished, Alde-barna, Altair, Rigel and Procyon filumine the sky Many gignalic sentions, peaks, and ammits fit their hade within a radius of a hundred miles of the local. These lie to the cast to the north, and toward the son in the west. The effect is hat of an amphilibeone sea in the west. The effect is hat of an amphitus-ater. The souls is open even down to the beach At annect large steamers look small indeed when compared to the face of the adjacent and Artist have journeyed to Echo Mountain to paint its numer splendors to imitate nature on canvas. But brush rpsendors to imitate nature on canvas. But brush ond possil are as impotent as words. The view of tlouds presented herawith is one of hundreds of thousands. When the first rays of the rising sun striks such cloud banks as these prismatte colors are seen that defy description—gorgeous oranges, carnations, and heliotropes beneath The effect is hightened by the singing of binds over the caryons. As the sun rises above the horizon the blossoming plains below, the domes and spires of los Angeles and Pasadess, surrounded by acres of roses, with bods of delicate white the come visition. As the clouds are dispelled, miles after miles of trinde cipruses, pepers, orangs, lessons, apriless of the context of the rot, almond, wainut, prune, peach, pear, and necta-rice trees, together with hundreds of long lanes, drives and roads adorned on both sides with tall,

drives and roads adorsed on both sides with tall, graviful event, byte trees, are seen Carpel a floor with jet black valvel, and throw down upon it a myriad of diamonds in wild combision, and perhaps you may conceive how the densely packed Milky Way appears from the observatory Millions is a word becoming astronomically obsolute; billions is a word becoming astronomically obsolute; billions of stars is an expression much more nearly tree of the Milky Way Billions of some appear in the influt deeps of the Galaxy Those constitute the aparent counte floor, the base of Nature, and of the stellar structura. In hundreds of areas, there does not seem to be piace for more stars. Millions are flowed in the star of the or better, over the rim of the eastern canyon. Then millions of stars seem to be pouring into the depths of tha reck-zero abyze descending low beneath the observatory. Floods of stellar points flow downward, as seen in the revareing sysplexs.

4 Kinemategraph Biffe Target,

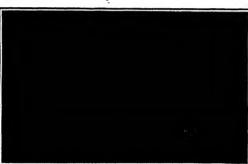

Among the novel used for which animated photographs have been utilized. graphs have been utilized, one of the most ingenious is that recently perfected by two English inventors, Mesura, J Paterson and J T Musgrave This is its application to rife-fire application to rifle-fire practice, the idea being to render the eye of the marksman keener, and to enable him to be more exert in the quick handling

The "bloscope target." as it is called, is of very sim ple construction and opera-tion. There are two rollers, upon which is wo ers, upon which is would a sheet of paper of any de-sired size, like the films of a camera, the clear space between tha two rollers comprising the screen upon which the pic-tures are thrown The

tures are thrown The lantern in placed behind the markmann in such a way that their movements do not interrupt or interes with the projection. I munchatary behind this refer with the projection I munchatary behind the lastantamously conveys the value of such short to an indicator at the frings point. The value of these hits may be graduated as required. Thus the maximum points corresponding to a buller eye are given for a fatal shot, another value for inflicting upon the objective a moral award, and the projective and the projective and the sum of ablement, and so on. The indicator not only on municates the individual hit, but at the completion the round, or practice, registers and gives value of hits made.

value of his mans.

The range can be varied from 15 to 25 yards as desired. The paper screen as it is destroyed by the bullet perforations is wound up on the second roller. The self vectoring mechanism behind the screen is so syranged that it absolutely synchronizes with the mereprangan tast it accountsty syncarronness with the sevents of the object in the picture, at which aim is taken, so that there is no possible chance of a wrieng value being given for an individual shot. The indi-cators are placed immediately, shows the unrimment bend at the firing position, and a fatal hit can be signified by the ringing of a bell. See with the ordinary

Grand panerams from Eche Mountain. Leoking due south from the Lowe Ob Land area is 900 square union. The cloud is exactly over Panadena. The observatory is shown in the foreign right of this view

THE LOWE CREEVATORY OF MODE MODETAIN, CALIFORNIA, U. S. A.

a pavement of starry sand. I never really saw this aidereal base until with the telescope up hers. After sevaral days of rain, the atmosphere is swept clear of sevaral days of rain, the atmosphere is swept clear or dust Then one is really within cominc deeps when the tolescope suddenty awasps over fathomises inter-stellar chasms, doors or windows through which one apparently looks into the very bottom of space. These apparently looks into the very bottom of spece. These areas are absolutely black. No sensation within the culir range of stellar research, at the hour of a monatian mindaint, is so completedly overspowering as ha vision of an abyes in the stellar foor Rousel and about these blackened wastes, there are consequently of the stars are opined to be suffered to the vision of the stars are opined to be suffered to the vision of the stars are opined to be suffered to the stars are opined to be suffered to the stars are opined to be suffered to the suffered to little star—the sun The giant nebula of Orion is a mass of starry la-

fabric loaded with glittaring points.

An astronomical telescope reverses all objects b An autronomical telescope reverses all objects before it. The rotation of the earth is very apparent on Robe Mountain With high powers, the stars go racing across the field of view. An incredibly starting affect is obtained when the telescope in set upon the Gelaxy is obtained when the telescope is set upon the Galaxy or Picindes just as they rise out of some distant peak. buil's any target. The pictures, which have been specially prepared for use with this apparatus, are of such a character as to develop the calerity and certainty of the marksman's aim to the supreme degree. o the enemy appearing on the picture first at a relative 100 yards range. He drops

on his knee and fires point blank at the marksman a certain number of rounds, corresponding possibly to a complete charge of his rife magazine. The marksman using the target raises his rife immediately the kinematographic scout is seen, but does not commance firing until the scout opens fire, the ap-pearance of a puff of smelts in the picture indicating the comment

of firing
The scout then retreats
at the double to a distance corresponding to 200 yards range, when the same cycle of operations is repeated The scout then retires once more until he eaches a point correspond ing to 500 yards range, and the same tactics are once more carried through It will be seen that in each phase the target becomes decreased in airs, according to the range, and at the maximum range offers s vary small object to the marksman Moreover, the fact that the latter has to discharge the whole of his rounds in the short period rtween the picture commencing and finishing firing at each distance, in order to score, indicates that aiming and firing must be accomplished very quickly Yet it has been found that in the course of hut little practice, the of hut little practice, the marksman can pick up the range and conform with the firing conditions so ex-perity that about untoely per cent of fatal shots can be got in with each round at the respective ranges. The invention is also ap-plicable to training in re-volver shooting, and for

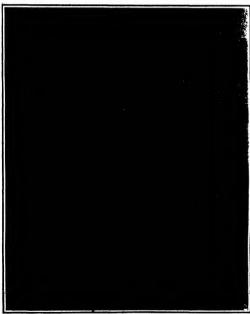

plicanie to training in re-volver shooting, and for this work an ingeniously auitable film has been pre-pared. It portrays a conauitable film has been pre-pared It portrays a con-flict with an armed house-breaker The hurgiar ef-fects his entrance through the window, under which in the room, a roll top deek is drawn at an angia In the course of his work In the course of his work the hurgiar is disturbed, presumably by someone entering the apartment. He instantly shields himself behind the desk, exposing but his head and shoulders, and cocks his revolver The burgiar's disturber is represented by the marksman at the fir-ing point, who at tha psychological moment the psychological moment the burklar is about to fire, empties his revolver. In this act the burglar pre-esuts a fatt-sleed target, with his pretruding head and shoulders at a few yards rauge. The burglar having emptied his arm turns to ecospe through the window, but in the act of frompting from the city

the window, but in the act of dropping from the sill, to which he clings by one had been as the head, and drawing his revolver case more, first. The markanian waits until he ones the burgiar's head right sponed and just shout to fir, and then shoots. In this case, wring to the greater rather and the sized area offered by the man's head and allocations in prolife, the area offered to the marks and and allocations in prolife, the area offered to the marks.

man's aim is somewhat small. The burgiar indicator represents in silhousts the head and shoulders of the burgiar in the two firing pecitions, and the vulnerable points of this part of the anatomy are shown on the adicator, so that the firer can instantly determine, whether he has struck the target in a fatal spot, has

inflicted a mortal wound, or has either missed entirely

inflicted a mortal wound, or has either missed entirely or only failfaid a feel wound.

The projection is automatically controlled. The lanters is electrically driven by means of a small mo-tor, and this is operated from the fring position by means of a small switch. The same picture can be

projected time after time, there being automatic do vices for winding and rewinding the speel preparatory g and rewinding the spool preparatory Being electrically driven, a uniform vices for winding and rewinding ine apon prepassion; to projection Being electrically driven, a uniform projecting speed is secured, and as it is directly under the control of the marksman the apparatua is only set in action when required

ed to an indefinite exient and the variety of pictures that can be used for im proving the fire of the proving the fire of the marksman is endless it can be adapted for tudi-vidual or company firing, and very realistic scenes can be pictorially pro-duced. The application of the bioscope to this place of military training often been advocated and indeed attempted, but stienspied, hitherto it has been found difficult to evolve a practi-cal simple apparatus. The British War Office has investigated and subjected the invention to searching tests, and has ascertained that marksmanship can be rapidly improved by this means that its general introduction into the serv ice is being contemplated.

A new method of bond ing new concrete to old was described by Mr Frank Barber, of Toronto, in a recent article in the Canadian Engineer This consists in piacing bags of cracked ice on the last ces of concrete placed at night, thus reducing the temperature of the con crate and, consequently, retarding its time of set ting, so that on the next morning the surface is still plastic and the constill plantic and the con-crete then placed will set in one mass with the old. The invention of this scheme is credited to Mr O L. Hicks, when he was contractor for a reinforced concrete truss bridge in Ontario As all of the members of these trusses. were of relatively small cross section the ire bags were easily placed in posi-tion, at the end of a day's work and it is stated that work and it is stated that the method worked very aucressfully To what ex tent it could be applied to heavier work is not as yet

Hitherto dew has been used as a beverage only in poetry, by the sun, flowers, and butterflies it has re-cently been robbed of all its postle character by be its posite character by be-ing used for the refresh ment of English soldiers The English administra-tion at Gilbraitar, where water is very scarce, now collects dew by the follow ing very simple method A large pit is dug in the earth and covered with dry wood or straw which, In turn, is covered either with earth or with sheet iron. The straw or wood serves as a heat insulator and effectually prevents the conduction of heat from the ground to the layer of earth or the sheet

S. A. iron, above Consequently
this earth or tron cools
after sunset much more rapidly than the ground so that its temperature soon falls below the dew point of that its temperature soon falls below the drw point of the surrounding air Hence dew is formed upon the iron or the layer of earth in very large quantities. The water thus obtained is drained off into reservoirs and after clarification is used for drinking

MORNING AND EVENING STARS FOR 1910

BY PROF. FREDERIC R. HONEY, TRINITY COLLEGE

The popular expression 'morning and evening stars while signifying those planels which at different periods lliminate our skirs, the observer will natur ally include in his study of the heav on the fixed stars nance indicates that they will be invariably

found in the same places on the celes that sphere. Their positions in the heavens may be sooner fixed in the memory by first observing the stars of higher magnitude whose conspicu on brightness casily distinguishes them from those of varying degrees of lesser brilliancy in this way the heavens may be triangulated visually, and in process of time all the constellations may be easily identi-fied. For such observations a star map is indispensible, and the posito right assensions and declinations which are given in the Nantical Ai equator from which declinations are measured may be delermined ap-proximately by observing the stars which are may it on the star map, and in the same way the position of the first meridian intersecting the of the first meridian line resceting the closistic equator at a point from which right ascendons are measured, may also be defined. Following this method as veu eighths of the celestial sphere (at latitude 46 deg.) will come within the range of vision, and the heaven may become any become one of the composition of the distances to the distances to the fixed stars are so great that (except to the astronomer) their apparent positions are not disturbed when the earth reaches the apposite point in its orbit—a distance equal to about one hundred eighty six milling miles. For purposes of observation the carth may therefore be regarded as

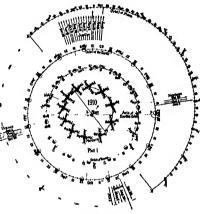

the center of the celestial sphere around which the stars appear to revolve once in a sidereal day, which is nearly four minutes shorter than an ordinary day, a nearly four minutes shorter ham an ordinary day, a difference due to the re-volution of the earth around the sun once in 165% days During this period the earth makes 3061, rotations out its axis. As a conse-quence the stars rise nearly four minutes carrier every day, and during the year the major part of the celes tial sphere comes within the range of vision at any

assigned hour of the twent thru The positions at any plausia are continually changing, and in or der to discover the restion of the heavens in which to search for them their situation relative to the sum and earth should be determined as illustrated in Plots 1 and 2. The piols of their orbits have been printed in the pilols of their orbits have been printed in the Sib 1971th Array on the blesses of the fol-lowing dates March 11th, 1906, Pebruary 10th, 1908, American Coll., 1908, and March Miller Period of the Sib 1908, and March Miller College of the Sib 1908, and March Are shown for every day of each year. To english the sib 1908, and a sib 1908, and the pilolic sib 1910 include. The orbits of all the pilon-cial for the fire consecutive years from 1906 to 1910 include. The orbits of the aster-ulds which are between those of Marc and Quiller, Shorry Harman, and Neyton, are too suntil to be visible to the naked eve, the largest of the suntil to be visible to the naked eve, the largest of the original that hundred being not more than five hundred miles in diameter. Several of the orbits are very eccentric and inclined at large angles to the plane of the cellpile

in order to bring the pites of the orbits of the phenets within the limits of the problem of the phenets within the limits of this page, the orbits of the terretiral pitestes, which include Mercury. Yenus the earth and Mara, are drawn to as large a scale as the space permits silice the diameter of Neptum's orbit is libity limes that of the earth, the pite of the orbits of the major pianets, including Josher Salver, Iramis and Neptume, are drawn to a wate which is very much reduced. In this pite the orbits of the arch and Mars are repeated by the reduced each, the region of the sarvoids or unince planets is indicated and the piota together show the outlimity of the solar system. The THE SET VID PLANTS

plane of this paper may be taken to represent that of the celliptic or the earth's orbit, and if it be placed in n horizontal position a planet which is on one side may be described as being situated above and on the other side as below the reliptic. In the plot of each orbit the full line represents that part which is above,

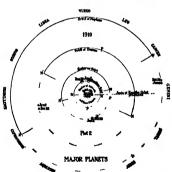

and the dotted line that part which is below the eclip-tit. The ascending and descending nodes N and N are respectively the points where the planet passes from the space below to that above, and from the space to that below the addition and P. the perhalical above to that below the ecliptic, and P. the perils

PLOT I POSITIONS OF THE PLANETS.

A fine joining the points N and N', the line of nodes, is the intersection of the plane of the planet's orbit with that of the ocliptic To avoid confusion, only a portion of this line is represented, except in the case

It is obviously impossible to represent the diame of the planets by the same scale. Even those of the giant planets Jupiter and Saturn would shrink to mere The same may be said of the sun itself in Plot

PLOT IL PLANETARY ORBITS.

2, but in Plot 1 its diameter (\$66,400 miles) would be a. out in Piot I is diameter (see, see mailes) would be correctly represented by a measurement a little more than one-half of c, which is the linear eccentricity—the distance from the sun's center to the center of the earth's orbit

The earth a mean distance from the sun (929 mill miles) is diminished by a little over one and o million miles at peribelion in January; and in

by the same distance at aphelion in July The center of the orbit is at a. At a velocity of 18.5 miles per second the earth moves each day on the average nearly 1,600,000 miles, with an increase of velocity at per-

inution at sphellon; making the com-plete revolution in 365½ days. The position of the earth is shown at in tervals of four days at Greenwick, noon, and intermediate positions and dates may be interpolated by subdi-

The plane of Mercury's orbit is inclined at a greater angle (7 deg.) than that of any other of either the terrestrial or major planets. Its eccentricity is also greater than that of any of the planets. By the eccentricity is meant the distance from the center of the orbit to the sun (the linear eccentricity) divided by the semi-major axis. The linear eccentricity is 74 million miles, and the iongth of the major axis is 73 million miles. Mercury's mean distance from the sun is therefore thirty-six million of 74 million miles respectively at perihelion and aphelion. At perihe-tion the planet moves at a velocity of thirty five miles a second, which is diminished to twenty-three miles a second at aphelion Mercury's orbit is a marked illustration of the first two of Kepler's three laws First The orbit of each planet is an el-lipse, with the sun in one of its foel tipee, with the sun in one or in no. Become The radius vector (i e, the orbit radius whose length is continually changing) of each planet describes equal areas in oqual times. For example, the area of the triangle with the sun as its vortox, and with the sun as its vortox, and with a base equal to that part of the orbit

included between the dates of August 30th and Septimber 7th, is equal to that part of the orbit he same vertex and for a base that part included between the dates October 9th and October 17th. In conformity with the second law, the issues of the base of the triangle is continued to the second law, the issues of the base of the triangle is continued the law of the base of the triangle is continued to the base of the triangle is continued to the second law.

the triangle is continually diminishing frem periholion to aphelion, and increasing from aphelion to perthelion, which accounts for the rapid variation in the phase's velocity. Mer cury's revolution around the sun is accomplished in very nearly eight-eight days (871). This is repeated over four times during the year, and four dates are attached to each good continuous distriction. The include of the production of the present variation in the phase's velocity the politions are in the phase's velocity of the present place of the perturbation of the perturbation

shown for every second day

"Even as "The erbit of Venus is inclined to the plane
of the erliptic as an angle of 34 deg. The

executricity is less than that of any other
planes, and is barrely visible in the plot, the

distance from the sun to the contro of the

oral is less than a half a million miles as

a someoteneous, the velocity of the planes in the

control as a sense distance of 47 a million miles

oral at a sense distance of 47 a million miles orbit at mean distance of 672 million miles is nearly uniform at the rate of 219 miles presented.

The period of revolution is 2347 second.

The period of revolution is 2347 days. The dates outside the orbit are those which belong to the first revolution, those within, to the second revolution, and that part of the orbit included between the positions of the planet for the first and second revolution of the planet for the first and second revolutions represents the distance travers in seven-tenths of a day MARK

The orbit of Mars is inclined at an angle of 1.85 deg.; and the center o is 13.3 million miles from the sun. The mean orbit velocity is fitness miles per second, and the mean distance from the sun is 141.5 million miles. The

period is 1.85 years.

The inclination of Jupiter's orbit is 1.8 dag.

The inclination of Jupiter's orbit is 1.8 dag.

The inclination of Jupiter's orbit is 1.8 dag.

miles.

The first inclination of the inclination period inclination of the inclination of the inclination of the period of two period of revolution is 1185 years. The direction in which the planet is soon from the sun is shown at increase of twenty days.

Sadurate orbit is inclined at an angle of 3.8 dag.

Reduced in the inclination and the mean distance is 186 million majes. The planets relapions and distance is 186 million majes. The planets relapions and distance is 186 million majes. The planets relapions and distance is 186 million majes.

CURIOSITIES OF SCIENCE AND INVENTION

A STREET BAILWAY AUTOROSILE.

le street railway has recently be installed for regular passenger service between Mands-ville and New Orleans, i.e. The cars are each fitted

A STREET BAILWAY AUTOMOBILE

ing them practically automobiles on rails. The line is 16 miles long, and steam motive power has been in-stalled in order to reduce the cost of maintenance. Two street automobile cars built as an experiment have proven so successful that more are now under have proven so successful that more are now under construction. Each car is built to seat twenty-two people, and the expense of maintaining the line under present power permits of a large saving over the ordi-nary electric street railway maintenance.

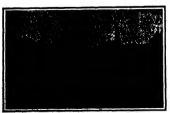

GALILEO'S TELESCOPE.

Just about three hundred years ago, Gallieo exhibited a telescope which he had used in studying the and planets. This was not the first to

THE FIRST ASTRONOMICAL TELESCOPE.

ver built, but it was however the first telescope to be used for safronomical purposes. The accompany-ing engraving shows how the telescope looked. This type of telescope differs from the present safronomical type in using a concave instead of a coavex eyepice, so that by a combination of but two lenses, the object glass and evenlece, he was able to view objects right

SCHOOLS PROPERTY BY MATCH-PARKER SPEAKED WHERE

side up, whereas in the present astronomical tale-scopes objects are inverted. The Galliean type of tele-scope is now used in the ordinary opera glasses. With this crude instrument Gallieo was able to establish the fact that the spoon is a round body with its surthe fact that the moon is a round body with its sur-face broken by mountains, that the Milky Way is com-posed of countless stars, that Yeaus and Mercury have phases little the moon, and that Jupiter has a number of satellites (four were discovered by Gallico). To bim Setura superared to be a triple planet. This pus-siling phenomenon was explained fity years later by turgyess, who sincovered that the planet was sur-lyspess, who sincovered that the planet was surded by a flat ring

AN EGG WITE A TAIL.

Occasionally, for one reason or another, a hen will lay a "soft-shelled" egg, but one with a tail, fike that shown in the accompanying photograph, is decidedly unusual. This egg was evidently the last or

AN ROO WITH A TAIL.

a clutch, and, though the ben lacked material for a shell, she had a surplus for the shell lining, or egg

A FROMEN TRESPRONE CARLE

A FROSEN TREEFRONE CABLE
The accompanying photograph shows the effect of
ice pressure on a twenty five pair lead telephone cable
The cable was located in a three-inth iron pipe, and
was run underground for fifty rest between the terminal pole and the manhole in the street. Owing to a fault in the construction of the interni, the pipe did not drain into the manhole, which allowed water to

THE RYPECT OF ICE OF A TELEPHONE CABLE

Last winter being an extremely cold one caused this Last whiter being an atternesty cold one caused this water to freeds in the pipe, the pressure retubing the colds out fait. In several places there was a quantity of small stones and gravel in this iron pipe and so strong was the pressure of the leve in the pipe that these stones were forced into that armor of the colds as though driven in by a hammer. The wires had the until pipe that the confidence in the pipe that the pipe for a distance of twenty feet.

MOTOR SCOOTERING.
Some years ago an amphibious craft was invented at
Great South Bay Long Island which could be manevered on ice as well as in the water. It was in reality an icebest provided with a flat-bot-

tomed hull which would foat the craft in case of encountering a bloweratt in case of encountering a blow-hole or broak in the ice. The sport proved to be very functioning, par-ficularly the peculiar senation of plunging off the ice into the water and then elimbing back again. The and then climbing back again The "scooter," as this craft is named, is now undergoing further develop-ment. Instead of depending upon the sais for power, Mr Nat Roe of the san for power, Mr Nat Roe of Patrhogue, L. I. has equipped his accoter with a 30-horse-power motor and a spurred wheel, which digs into the ice and drives the craft along He claim, to have traveled over the ice at a rate of 90 miles There is so m

water, but the sport consists in leaping gaps in the ice by the sheer momentum of the craft He has leaped gaps of over a hundred feet in this way. The motor scooler possesses an advantage over the motor sled, because it cannot slak in case of braking through the lee, and over the sall scotter in the fact that under its own power it can be taken home over snow-covered roads when the cover troops (fred of

LARGEST PROJECTILE IN THE WORLD

The accompanying illustration is of more linn ordin ary interest from the fact that it shows the largest

LABORET PROJECTILE IN THE WORLD

and heaviest projectile in the world being the hugo 5-loot, armor plerting whill first from the Obited States governments great thints rifl. This giant shell and powerful kind an considered two of the most destructive and dendiv engines of warfare in exist destructive and dendity engines of warfars in exter tene. The unusster 16-lnd rifle the only one built so far is now at the Sundy Hook Proving (frounds, and has only been fired a tew times. The lunge shell of steel can be juried a dictance of 20 miles or more and weighs 2 100 pounds—the powder charge is nearly 500 pounds. The cost of firing one shot reaches in the neighborhood of \$1 000—it is not probable that this type of gun will be used but rather the 14 hich for the main coust defences of the Panama Canal and possibly the Philippins. This formidable and long range weapon though capable of firing so tremendous a projectile is too costly and fires too slowly for modern

INTERLOCKED WOOSE ANTLESS
A curious veite of a famil battle between two bull moose is shown in the accompanying illustration. The battle was fought in the Kenni Peninsula Alaska a few years ago. An indian was attracted to the spot by the noise of the encounter, and on nearing the two antagonists he found that one had broken its neck during the striggle and lay dead on the ground white the other partly exhausted was making desperate of forts to free his horns. After killing the latter moss the indian tried in every way to separate the antiers but found this to be impossible. The interlocked but found this to be impossible. The interlocked antiers are soon to be exhibited in the collection of heads and horns in the new Administration Building of the New York Zoological Park. The larger pair of horns has a apread of 69½ inches and the other of

THE DESIGN FOR THE NEW QUEBEC BRIDGE

COMMONPLACE IN APPEARANCE AND COSTLY TO BUILD

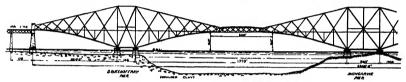

The collupes of the long, cantilaste bridge at Quicker August of the Nort, was at once the structured and mose final entertropic to all the history of bridge out attraction motion. When that independ structures broke down under the earn which tands appared from which the North State are likely independent of the state of the state of the control that rights famous lives and many millions of deligence has being the state of the state of the control that rights famous lives and many millions of deligence has the state of the state of the state of the state of the control that the state of the state of the state of the control that the control that the state of t

An investigation of the facts by a Royal Commission revealed as the cause of the collapse faulty design of the compression members—It was ascertained that the slightest attempt to combine the beautites with the under The faulty structure which collapsed had at the collapsed had a second to the collapsed had a retructurally and snathetically correct, and although the borth Bridge has been made the subject of much crititism by the arriest and the arributes, it must be regarded as baving distinct claims to beauty when compared as on the accompanying page, with the new

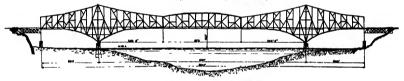

garded as having distinct claims to beauty when compared as on the accompanying page, with the new pinan for the Quebe Bridge
II wend seem, however that the Board has some doubts as to the merits of its own work, for it now harder competitive pinan from contractors which are to be filled by Bay 1st, 1310, the pinan which are to be filled by Bay 1st, 1310, the pinan which are to be filled by Bay 1st, 1310, the pinan beauty and a the contractor moment times after a pinal sit 5000 of the produce of the pinal sit of the pinal sit of the produce of the Board dispersionable firms to furlable them with new plans in one-sixth the time and for neithing?

The lay of the land at the Quebec crossing is such to make it almost certain that a thoroughly rigid pressure during high gales, and particularly is this provision necessary to theare safety during sweeten. The bridge which falles was only 87 feet what the small width was a large contributing cause to the visiting of the structure during exection, which preceded its collapse. This important fact does not seem to have been given authentic consideration, for the new structure has a width of only 88 feet, or one-tracted by the proposed length of gans of 1,786 feet, as against one-fouriesnth in the Forth Bridge as against one-fouriesnth in the Forth Bridge.

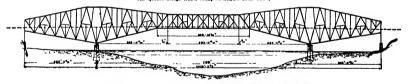

as against one-four-tenth in the FOTE Bridge,
it may be claimed that superious with American
it may be claimed that superious with American
proportion of 1 to 20 to be sufficient, but it is a question how far their immunity from disaster during
erection was due to the fortunate circumstance that no
strong winds were experienced—such as frequently
occur at the Forth Bridge, and may occur at question—which would have twisted its trusses out of shaps
before they had been connected up. Morovers, we berelated to the continuate over which trains
artituded bridge on this continuate over which trains

One-half of the cantilever bridge, Firth of Forth, Scotland; completed 1890.

The Quebec bridge which collapsed August 20th 1907,

The analysity structure now proposed by the Canadian government for the Quebec bridge.

THE DESIGN FOR THE NEW QUEEZO BRIDGE

management of the work was so badly organized, that the blasm could not be definitely fixed in any one quarter, and in the end the Causaldan government had to any one of the country flow. The work was even to be a comparable of the country flow of the country flow to the country flow. The work was even cluded to result the structure. For this purpose a commission of three engineers was appointed, and it was publishy amonumed that the new bridge would be the finest and strongest structure of the kind ever seen.

The Commission was appointed about eighteen months ago in the intertin the preparation of the plane has cost about \$130,000, and as the result of its eighteen months work the Commission has produced the very commongate educin, how-with Hitsdrated, re, sarding which there is a general professional opinion that boils structurally and esthetically it is distinctly interior to the Forth Intelige, which was completed nearly livenily years ago

nearti (well) years ago
If the bridge is built according to the proposed
plans, it will not only be of inferior merit, considered
from the bridge on enterer a standpoint, but will also
be lie ugilest bridge of monumental proportions among

formed of Baldwin's value silk-proof material, and which is colored black according to the fancy of Mr. places according to the many or an Pitturer; is laced on in sections and is held to the ribs by feather bone and tacks. A section 30 inches long is left out at each and of the plane. This sec-tion is to be occupied by the sliding wing tip These wing tips or equalisers, which are 30 inches wide by 5 feet deep which are 30 inches wide ny a see usey, have the same curvature as the main sur-face, and are each formed of three ribs connecting a front and rear edge, which slide in a suitable track made of steel side in a sintable trace made or stead tube rails extending the whole length of the outer section of each wing, i. e., 5 feet, and allowing the stiding tip a 30-inch and allowing the sitting tip a 30-their trivel. In their neutral pointion these wings the extend 15 inches beyond the wings the extend 15 inches beyond the flow the first of the control of the control you are the end of the wing, the other is found in the end of the wing, the other is drawn in homest the end of the opposite wing. These tips are connected by a long cable, which passes over pulleys and is wound around the control wheel, so that when the wheel is turned to the right the left wing ip is fully extended, and the left wing ip is fully extended, and the left wing ip is fully extended. The end is 12% square feet, when one it fully out-ineded and the other withdrawn, there is a difference in lift at the and of the wings of about 50 pounds at 46 miles and the opposite of the square foot. The horiestantly under in front and the travel. In their neutral position these

The horizontal rudder in front and the

The horizontal rudder in front and the tail at the rear are mounted on two trussed rods extending about 14 feet in front of and 10 feet behind the main plane. The horizontal rudder consists of a main beam about a third of the way from the front to the rear edge, upon which the ribs are mounted. These ribs are connected together by a light front are connected together by a light front. edge of wood and at the rear by a wire cable. The rudder is balanced. At its right end is a double vertical lover, which is connected by wires to a similar lever on the transverse shaft at the base of the on the transverse shaft at the base of the control column. The latter lever can be seen in the three-quarter front view of the machine. A forward and backward movement of the control wheel depresses or raises the horisontal rudder. The ver then rudder is connected to the control wheel in such a way that when the wheel is rotated about its vertical axis the rud der is set to turn the monoplane. The motion is the same as that used in steer ing a bleycle. The vertical shaft of the ing in the supporting bracket, the transbearing Cables connect the ends of this lever to a similar one on the vertical rud der In order that the length of th der In order that the longth of these cables may remain the same during the foreandaft movement of the control wheel, the bracket at the base of the con trol column is arched so that the anda of the steering lever just mentioned are in the center line of motion. The cable that constraint the wine ting, and which is on the according sever just mentioned are to the more than the control of the con the future, as we understand it is the inventor's intention to give it to the p

wenters intention to give it to the public and not to patent it.

All the woodwork used in the construction of this monoplane is of sprues. The sprurs and strate are solid and have their front and rear edges tapered, while the rear the are laminated with the exception of the motor, redistor, and gives cables, the whole machine is finished thick and (Considered on page 442.)

THE DESIGN FOR THE NEW QUEEZE BRIDGE.

REIDGE,
(Concluded from page 148)
low height of 290 feet necessarily increases the weight of a cantilever, and if
used for the towers of a suspension bridge would result in a flat catenary, requiring would result in a flat extensive cables and unusually heavy and expensive cables and anchorages. The great height of the tow-ers and trusses in the Forth Bridge has an important bearing upon its rigidity under fast trains

an important bearing spon its rigidity under fast train in the fact of low height and parrow within in relating the weights is shown in the fact that the amount of steel to be put into the Quebec Bridge in a length of 2.600 feet is estimated at over 6.00 feet in out and of the fact of 1.000 feet is estimated at over 6.000 feet in the profit his continuous of steel in the 55,000 tons in other words, the narrow Quebec structure would require the enormous average amount of 24 tons of acts (about half of which morrower is nickel steel) per lineal foot, whereas the wide and rigid by both Bridge routired aff average of only 10 tons of carbon steel per lineal foot. It is true that the train por lines fool It is true that the train loads assumed for the Queber Bridge are about three times as heavy, but it is well understood that the weight of steel in any bridge of great span does not increase in anything like the same proportion as the live load

Four-fifths of Your Blacksmiths' Troubles

How does your fire burn? Is it sometimes hot and sometimes it come up very fist and then lose its heat? Is the red finne edged with blue? Is the coke formed dark-colord and crimbling? Do you have trouble getting good solid welds? Then—You're Using the Wrong Coal. You SHOULD USE

WEBSTER SMITHING COAL

Try these simple tests on the coal you are using:

1 Crack open several pieces the suz, of your fast. If little white sedes or brown deposits type, it between the layers, they are sulphur it is both for from a sted and besolutely presents good welds. Webster Smithing Cod's practically free from sulphur.

2 -Look at the toke formed around the edge of the fire - If it is dark and crambly the coal contains much dirt. Webster Smithing Coal foams a clear hard gray coke, of even grain, which when burned over, in ites a hot steady here.

3- A blue edged from indicates sulphur. Webster Smithing Coal, being practically free from sulphur makes a pure red and yellow from

4 - 1 m/s, closely at your coal-pile and see how many pieces of dull gray slab van en pick out put from the surface of the pile. State is not coal it will not burn and it keeps the coal with which it is mixed from burning lietly. Webster Suithing Coal contains no state. It is pure Coal

5—If your fire is hot in spots, or for a short time, and then drops out! the coal is low in hert efficiency—is not adapted to similing Welster Smuthing Coal maintains a high clear heat for a remarkably long time, because it is all jurie heat-groung coal, specially selected and specially prepared for smithing

It pays to use Webster Smithing Coal. Saves dollars on coal bills. Avoids fire troubles and welding troubles Improves the quality and quickness of work

Webster Sunthing Coal is all mined from one basin in Cambria County, Pennsylvania, right in the heart of the region noted for high grade sinthing coal Sold by local coal dealers anywhere in the United States and Canada or shapped direct in bags, in bulk or car load lots. SECRETARY MEYER'S PLAN FOR THE RECREANIZATION OF THE NAVY

THAT one of the first acts of Mr Meyer on usseming the extremely difficult ond respon sible position of Becretary of the Navy, would be to make a thorough investigation of con-ditions with a view to placing that very complicated orthing with a vew to justing that very completeners also a new label as severable must have foreseen which familiar with the excellent work of reorganization which he nehrved while helding the position of Post most, will never

a changes introduced by Mr Mever ore nece sarily supplemental to the work of his predecessor Newberry who had formulated and put into effect a system of consolidation whilele, in the brief period a system of consolidation while, in the brief period of its uperation bed shoon excellent results Mr. Mevr has assured us that the chonges which he has instituted in the Newberry plan have been made not for the purpose of reversing but rether of amplifying the work of consolidation inaugurated by his prede The essential changes involved in Mr

Cessor The essential thatages involved in Mr Meyer a "pish are summarized under the following heads (1) The pruvialoo of four responsible advisers to the Secretary) un subjects within the groups intu which dulies of the Pepariment inglishly full 12) The grouping of the Dureaus into two divisious

of material and personnel according to the unince of

(3) The establishment of a Division of Operations

(4) The establishment of a comprehensive inspe-Hou system of a permane at organization whose offers shall be periodically thanged who will come mainly from the active flot and be conversant with the latest ips and the modern methods of drill and orgo

(6) The catabilishment of a modero and efficient coat keeping system in the Navy Department and of

navy yarda. e separation of navy pard work into the two

natural divisions of hull and mischinery
(7) He intends to require that commandants and
ciptains of jurisd for many varia shall be selected for
their knowledge and experience and that their tonuer
of office shall be lour enough to Insure continuous

administrative policy The Separate Augustan has before it the printed record of the hearing of the Secretary and various an cidefa before the House Vaval Committee as pointed to consider the proposed reorganization, and, after giving the same a most enreful reading, we have come to the conclusion that with one very serious exception, the measure proposed by Secretary Meyer ar well adopted to promote that consultation which Mr Naherry began and which the present Secretary 14 endeavoring to place upon a lasting workable basis.
The appointment of four aides, independent of the whose duties will be to inform and advise the Burelary on metiers coming noder the four g erol heads is an excellent arrangement the need for which had been keenly felt by previous secretaries. The Aldes for Operations of the Fleet, for Personnel and for inspections are to be line officers. The ques-tion as to whether the Aide for Material should be chosen from the line or staff is left open. We are decidedly of the opinion that in seeking for advice on the question of material that is ships, engines navy the question of material that is stype, engineer may rards at the Screeney should have as his adds the Chief or some high tanking Naval Constructor, who by training and experience he best qualified to advise upon these subjects. A proportion of three itos officers to one staff officer among the aides would give a fair representation of both branches of the service, and would nut the Secretary administry in touch with the

whole range of active work in his Departs whole range of active work in his Department.

The feature of Secretary Meyers plan which we consider to be upon to very grave question is the proposal to securate the navy yard work into two divisions. post to searrate the nery yeard work into two divisions of built on machinery, with a separate and independent manager for each for the change involves the étieut of one important object of the Newberry plan as affecting the neary years, namely the securing of efficiency, and the avoidance of confusion and delay, the marry, and the abole of the work offering the con-struction of the ship in charge of the afficers of a single corps with a member of that corps as general works manager of the yard. Mr Meyer recognizes that a navy yard is a military establishment and musi be under odditary government but this condition was not under the Newberry plan by placing at the head and under the Newberry plan by pine tog at the seaso of the yard a commundant who is always a line officer of high rank. Under him came the manager, a naval constructor whose executive powers were recognized me covering not the military, but the industrial side of the work. In view of this distinction, we fail to of the work. In view of this distinction, we find the see how the management of the yard as to fits non-rillitary and purely industrial features by a staff officer of the naval construction corps is, in any pos-sible sense a total in or of that law of Congress, ac-cording to which a staff officer cannot exercise unit lary command over any other than members of his Under the former ireagoing) officers of the Engineering Corps, who acre temporarily assigned to the steam engineer ing department at the navy yard were subject to the

und not in the military senso If it is advisable fur economy and efficiency and the consensus of evidence is overwhelming on this point, that the navy yards should be under a cingle indus manogonient and that this manogement should rest in the naval construction corps, and if under such an arrangement any legal question is involved as to the right of the constructor-manager to exercise non who may be temporarily assigned to duty at the yard then the somer the law is modified the better for the interests of the navy, and of the American people as

al constructor monager, purely lu the industrial

If it be asked why both hull and mochinery abouid be placed under the control of a single head, and that lead the naval constructor we reply that the bull and the mochiners are merely subdivisions of one organic t buk and that the two are an greatly interdope as to make it makessary that their design, constru and anissequent repair be under the management of a single curps, who are qualified for the work by train-ing, knowledge and practical experience. Now, we veniure the statement without any fear of successful contradiction, that the ma body of men who combine the necessary knowledge of navni architecture and steam and electrical engineering to qualify them for the oversight of the construction and repair both of the built and the machinery is the corps of naval con structors. Unfortunately, much of the evidence which is been given before the committee has been directed to proving that the naval constructor is ignorant of in and electrical engineering and therefore not lifted to take charge of the shops devoted to these branches at the novy yards. That nothing is further from the truth is shown by the following consideration of their training and experience

In the first place the naval constru of the Saral Academy graduates. They are selected from the highest numbers in their class ond, as a rule have been taken from the first two or three. In making the selection in addition to their academic standing careful consideration is made of their gen ral optifude for the service as shown during their and optitude for the service as shown during their there or faur years at sen, of their general officer like qualities, and of their aptitude for the handling of men, and for governel administration. The principle of selection is the same as is followed in the case of that other highly specialised and most efficient body of professional men, the corps of engineers of the same Africa of their education as line cliebres at sea same). After their education as line cliebres at sea ronstructors are given at the famous Mass Institute of Technology a post-graduate course in naval construction, which is the most thorough of any in

Furthermore (and we cannot too strongly insist that opression that the naval constructor is the unpression that the navia constructor is not a quali fit d siam engineer is abouturly eronocoust the course at the Massarhusetts Institute of Technology involves also thorough instruction in steam and electrical engineering during which the prospective constru-tors are given a course of practical training in the

rachine shops and inhoratories of the institution.
The life work of the naval constructor will be d on shore and mainly at the various navy yards, and on suore and mainty at the various mavy parts, and by virtue of his long residence at these yards, or as inspector at the various private shipbuilding yards, he kathers an over-increasing and immehaely valuable knowledge of the operation of these great industrial pronts: Future promotion and distinction for him lie dge of the very intention for him to Future promotion and distinction for him to these lines. There is every incentive for him to along these lines. There become thoroughly profit

Withighe line officer, however, into whose ha Meyer's plan would commit the construction of all electrical and steam machinery, and the management of the large and elaborate plants at the navy yards where this work is done, the case is entirely different.

After his four years course at Annapolis, the prosjective naval engineer goes to sea with the expectation of spending practically all of his time affects, a saturally, his sympathies, interests, and above all ambitions, will be connected with sea duty. As as signment for service ashore is merely a break in the signment for service assore is merely a press in the routine of his chosen life work. If the line officer be an engineer officer, he will calarge at sea his knowledge of the care and operation of a ship s machinery, but since by far the greater part of his timo is spent affort, his opportunities for becoming acquainted with the complicated and difficult work of managing such large industrial concerns as the steam machinery shops of the navy yards are, in the nature of things, very limttrd His work is to run not to build, the engines. just as it is the work of the captain of the ship and not to build the hull.

on when the line officer is ashore, his interests Even when the line officer is ashore, his interests and future sims are still upon the sea, and, as a rule, he is only too glad when the next assignment for sea, they comes. Proof of this is found in the fact that during the past six years there have been at our seven the leading navel yards, no less that 22 commandants and 41 capitains of the yard Evidently, the see-going officer connot too quickly get back to his natural sphere of

If there were available at the proof engineering officers who, like the navel constructors, had been specially trained for above duty in the man-agement of the machinory shops, etc. at the navy yards we would have more hope of the success of this particular part of Mr Meyer's plan, but outside of a few of the older engineers, trained under the system obtained before amaigamotion an each body of men is available Furthermore, it is our conviction were such a body existent it would still for economy and efficiency, if both full and machins placed under the single management of a naval countructor

That part of the Newberry plan which affected the That part of the Newberry plan which affected the any yards was string very promision results at the state way read was string very promision results at the time Me Mayer took office. We have little doubt that his determination to separate hull and unchange was proverned largely by certain alleged leatance of the capacity of the near constructors in taker manual of the mark the shops which were supplied to the Secretary, most of them over the signalure of the Euglineer in Chief. The testimusy before the Heauthorn in Chief. The testimusy before the Heauthorn in Chief. The testimusy before the Heauthorn in Chief. Natal Committee now before us however shows that a subsequent examination of these reported cases has elicited from the commandants of the various yards (all clietted from the commandants of the warfous yards (all) of them line officers] a complet disproval of the charges as made —a very gratifying vindication of the work of the unait constructs in this particular regard. We examel but feel that with this later evidence before the west of the Secretary will be disposed to reconsider that part of his otherwise exection reforms, which proposes to separate bull and machinary and that he will allow the Newberry plan of a single man-agement amfelent time to further demonstrate the conomy and all round efficiency of which it gave in the few months of its operation such great pro-

ELECTROLYTIC REMOVAL OF GREASE.

N electrolytic method of removing gream from objects has been introduced in Germany opects has been introduced in Germany of the Common only a rapidly removed from metallic objects by employing it on a cathods in a hot solution of potash or soda by a live was supposed that the alkali metals set free or the cathode transformed the fatty matter into some, but Barth has now shown that substances which cannot be saponified. such as machine oil, paraffine oil and paraffine, are removed very quickly by the current, and he explains removed very quickly by the current, and he explains this fact by mechanical action caused by hubbles of hydrogon which come of at the exhibit This action is produced only when the fatty matter is liquid if the temperature of the bath is too low so that the arrage is consistent, the removal is very size and incomplete He operation with a moderately concent ratted solution of exhonate of potath heated between 88 and 100 deg C at the anode he uses sheet iron the contract of t trated solution of exposure or services and services of the se

To permit two steamers to pass from the Wisconaria River to the Mississippi River, near Prairie du China River to the Mississippi River, near Prairie du China, a millium pridage on the Chicago, Buritagaton, and Quinor Railway was raised by breakfows creases as few works ago There is no newigation on the Wisconaina River, but the two steamers were sent down to ester service on another route. The railway creases the river near its mooth, and a 65-root span was related about 6 rest to olser the studency function.

ENGINEERING

George W. Melville, Engineer in Chief of the United States Navy, states that there is every reason to be-lieve that two ships of the navy will be fitted with the invotes that two samps of the many min on titled with the front page of our last issue. It is proposed to re-ongine the "Battimore" with turbines of 13,800 horse-power and equip one of the new colliers with turbines of 5,600 horse-power, both employing his reduction gear.

The number of persons killed in train accidents dur ing the months of July, August, and September, 1909, as shown in reports made by the rallroad companies to the Interstate Commerce Commission, was 193, and of injured, 3,752 Accidents of other kinds including those sustained by employees while at work and b meers in getting on or off the cars, ale the total number of casualties on to 20 093 (852 killed and 19 241 injured)

The Shoshone dam in Wyoming, which forms the kading feature of one of the projects of the Rociama tion Service, has recently been completed it is built of concrute, and measures 328 4 feet from foundation to the creat it is 175 feet long at the top and 85 to the cress It is 176 feet long at the top and 85 feet long at the bottom, whore its thickness is 108 feet. The reservoir back of the dam, which has a capacity of 455,000 acre feet, will serve to irrigate 139,000 acres of land situated about 75 miles seat of the Yellowstone National Park

The grand total of canal excavation at Panama for the month of December was 2,811 681 cubic yards This is 362,366 cubic yards more than the total for November, but 1,068 656 cubic yards less than the November, but Joss 866 cubic yards less than the highest record made in March 1809 Of the grand total, 1,485,611 cubic yards was dry excavation, removed principally by sleam shovels. The dredges removed 1,366 970 cubic yards in addition to the amount umped into Gatun dans by the suction dredges en gazed on that work

In recognition of the culmination of his life work in the discovery of the North Pole, the Senate has passed a bill making Commander Robert E Peary a rear admiral on the retired list. This algust recognition of the explorer followed closely upon the recent bering presided over by the (lovornor of the gathering presided over by the thoromor or the cause of New York at whit b Peary received a gift of \$10 doll which, by the way, he immediately contributed to the proposed American expedition for the discovery of the South Pole

Motor Mason M. Patrick of the United States army speaking on the subject of the construction of an artificial island and additional fortifications near the en trance to Chesspeake Bay, drow attention to the fact that the two largest and featest merchani vessels afoat to-day could each (arry 10 000 men with all their mu DE UT WAT, AT d if imopposed, could land them or cur coast lu less than one week and he also stated that more than one foreign power possesses a fleet of swift transports which can carry at one time over

Secretary Meyer has asked for a large appropriation the enlargement of the government drydocks i suit the huge battleships now under construction. He also asks for the construction of a \$2,000,000 drydock at Nordek, for an additional \$1,000,000 for increasing the new dock at the New York navy yard to a length of 700 feet, for an additional \$1 500 000 for increasing the Puget Sound dock to a width of 110 feet, and for the culargement of the width of the Pearl Harbor dock, Hawaii to the same width at an increased cost of

se new terminal station of the Pennsylvania Rail road Company at 33rd Street and Seventh Avenu Manhattan, is so far advanced that it will be pra-tically completed by the end of next month. The fir The first to be put in operation will consist of multiple unit, standard size, electric trains running to Jamaica Long Island, over a four-track road, which will soon be increased by the addition of two more tracks. This will be followed by the opening of the through express service to the West, which will be operated by the 4,000-horse-power electric locomotives illustrated in cur issue of December 18th, 1909

Were Jules Verne with us to-day, he would be greatly Were Jules Verne with us to-day, he would be greatly interested in two instances of rapid travel recorded during the past week. A traveler from London to San Francisco won a wager by overling the distance in two hours and thirty five minutes less than ton days, the trip being made by the "Mauretania" to New York, the 20th Century Limited to Chicago, and the Verstand Limited to San Francisco: A passenger from the Chicago and the Chicago. Lima, Peru, in making a hurried trip in response to a call to London, left Lima the same day by steamer to Panama, crossed by the Panama Railroad; made close Panama, crossed by the Panama Hailroad; made closs connections with a steamer for New York; and causing the "Mauretania" for England If the ship makes an average passage, the whole trip will have been cov-ered in 16 days.

AERONAUTICS.

The first exclusively aeronantic show to be held in America is open at present in Mechanics Building at Boston A score of full-sized representative neroplanes Hoston A score of ministed representative neroptanes of all types, tegether with a large number of models, are on view Several competitions for models will be held, and some of the gliders and motor-driven sero-planes may be tried out upon the lee of the lake in Franklin Field This exhibition will give one a good idea of the state of aeronauties in the United States

On the 10th festent Withur and Orville Wright were d with the Langley medals of the Smith institution by Chief Justice Fuller at Washington Dr institution by Chief Justice Fuller at Washington Dr Alexander add or Benator Henry Cabot Lodge made brief addresses Wilhur Wright an nounced that as soon as he and his brother get their rican company under way they expect to devote American company under way they expect to curvue their time to research wark in addition 1 he two gold medals were designed by J C Champiain a number of the French Academy, the reverse being from the seal of the institution, which was designed by St Gandens

Paulhan has expressed a willingness to fly in the icinity of New York if Curtiss or son exted person will have that injunition dissolved which exted person will have that injunition dissolved which in now hangs over the heads of avisions using warpable planes or hinged wing tips. His brilliant success in California leads one to hope that his desire may be gratified in the interests of a sport of which the United States in general and the East in particular knows lamentably little If Paulhan really gives an exhibi tion in these parts he will do much lo stimulate New Yorks interest in aviation The Hudson Fution flights tion in these parts he will do much lo stimulate Now Yorks interest in aviation The Hudson Futton flights were after all a flasse, and yet they ruused New York to an inituse pitch of excitement. Paulhan ought to

The first week of February the suit of th brothers against Paulian for an injunction restraining him from giving exhibitions in his barraine biplane was tried before Judge Hand in the United States Circuit Court in New York city Index Lind main tested great interest in the (ass. and his decision is swalted with interest. It is uncertain whether he will awaited with interest. It is uncertain whether he will grant a preliminary injunction as indee Hazel did at Buffain tast December. In defending the attack of the Wrights upon the Bieriot monopiane. Mr. E. R. Newell asserted that Pruf S S Montgomery's natent which aniedates the Wright patent, covers the same system of plane warding as the Wrights themselves chine and he further says that the muchine as built to-da does not correspond with the patent. A full report of the Wright-Curtiss case and the text of Judge Binzel's decision appears in the current Supersuper

As soon as he had finished liylug at Los Angeles, t'harles K Hamilton went tu San Diego where he made er of daring flights with his Curtiss biplu On January 21d, after starting from the vasi plain near the Hotel Del Coronado Hamilton twice liew uni over the ocean so far that be disappeared from view for ten minutes. When he re appeared he came from a different direction. In the first flight he covered about 10 miles, and in the second one 15. The wind was blowing at times as high as 20 miles an hour. After circling upward to a height of about 800 feet. Hamilton stopped bis motor and made a wonderful long straight stopped his motor and made a wonderful long straight glide to earth. This is probably a record performance, uly the longest gilde ever made in America. week later at linkersfield Col. he made two excellent flights under difficult conditions. Starting from a half mile track, he flew about the town and out over the ort and adjoining oil fields, finally lands fully at the starting point. His mastery of the biplane

Subsequent to the Los Angeles aviation meeting M authan made excellent exhibition flights at Sar Fauniano, Donver, and New Orleans at Han Fran-Francisco Donver, and New Orleans at Han Fran-cisco on January 24th he made several dights in a strong wind the last and highest of which of 12 minutes duration, was made after sunset. Two days later be rose to a height of 1,300 feet in a flight of later be rose to a height of 1,500 feet in a flight of a linuted furnishin On Fohrmary 1st, at livewer, he was mobbed by a crewd of 30,600 people cagor to see him fy After three prilitations; attempts, he finally left the ground and made two tircuits of the course of Overland Parts. The next day he made a lientife cross-country flight in a driving snow storm in starting, he sails he Forman believes through snow three hims, he was he Forman believes through snow three the properties of the prop sep, and when he alighted, the plane struts of the machine were in many places covered with snow, while Paulhan himself was suffering from the hitter cold Previous to this long flight, he made a nitter cost Previous to time long nigni, so mace a preliminary dight of 8 miles. On February 4th after circling the Park successfully a dozen times, Paulban twice was unsuccessful in starting in the distance at his disposal The first time one of the wheels of his his disposal The first time one of the wheels of his machine struck the fence and was knocked off while the second time the machine crashed into the fence and was demolished Paulian was nahurt, but several speciators were injured.

The original lumi osity can be restored by passing an electric discharge through the tube. If one end of the tube is heated to 750 deg. F. while the other end is coded by immer sion in liquid air and the tube is then allowed to return to the ordinary atmospheric temperature part which has been heated glows much more brightly than before. The luminosity is also greatly in crossed by substituting a tube of fused quarte for the glass G Claude is endeavoring to utilize this remark able property of mean as a source of light and claims to have constructed mean lamps of an efficiency equal to about 1 watt per candle power.

DID GREAT BRITAIN HAVE THE FIRST "DREADNOUGHT"?

THE "ROYAL SOVEREIGN" OF 1862

BY PERCIVAL A. HISLAM

The SCIPMITTE AMERICAN for November 20th, 1809, contained a description by Mr William Boerons Watmars of the U S S Rounoke' a converted steam frigoric, which he claimed to have been the original Irigate, which he claimed to have been the original printity of the Drasdought. The date of the con-version of the Boanole, from the Frigate into the hierarchical to found was 1833 but Praginal, the hirthplace of the teachieth cuttury Drasdought, her a shulfar instance to the Konnoke, but which dates from the pixtons year—1862 The Boyal Solvenign as this ship was named, was

The Royal Sovereign as this saip was names, was abilit as a three-deviced sailing ship of 3,44 tons and 120 guns and in 1860 had been fitted with engines of 800 horse-power. The sides of the 'Royal Borersign' effer conversion were composed of three feet of solid strong bened internally with discousi iron nd clothed externally to some distance belo beauts and control externancy to some distance occur the waterline with 5°1 line rolled armor plates. One line iron plating was laid upon the deck beauts, and over the iron plating was laid the deck proper, cos-setting of 6-inch and 8 inch oak planking. From the elder of the ship the deck sloped upward to the outer circumference of the tarrets, which thus appeared like

circumference of the farrets, which this appeared like circular fortie on the apex of a glack.

The following description is taken from a contem-perary meannt in the London Times newspaper "Step-plus on the Royal Soveredge's upper deck, we find itus on the Royal Sovereign's upper deck, we find that her itshit iron buiwarks, 3 feet 6 inches in dopth are thrown down outward on hinged stanchions. On the creat of the deck stand the four turrets and pilot he use, funnel casing, hatchways, and ventilating shaft. The formost turret standing five feet above the deck, has its top covered by a grating, and is surrounded by a handrail, and thus affords a deck promonade for the other of the wath nr lookout man Fb alongiegun turrels are 4 feet 3 inches above the deck.

if was claimed at the lime that the method of munt-ing and working the guns in the "Royal Soversigu" was superior to anything which had then been applied in any American turret ship. In American design in any American turner support deck, and was thus liable to easy disablement, but in the English vessed the lease of the turnet was on the lower dock, and the cita del was there fore much less likely to be disabled by a hit. The American method resulted in the turnet being nine feet above the deck while in the "Royal Sovereign" only five feet nr four foct three inches, as the case might be, was exposed to the enemys fire. further, the latter ships turrets could be worked by rack and pinios inside the turret, by the same method from the outside, and hy handspikes worked like cap-

Iron to outside, and by manuspines would not expended as well as by steam

It will be seen that the "Royal Sovereign" had four turrets—one more than the Roanoks", but she had one gun less, for while the foremost contained two guns, the others had only one each All the turrets mounted on the center line of the ship, and the gans were muszle loaders of 12 % tons firing a 300-

e original spe d of the "Royal Sovereign" had b 19 25 knols, but after conversion this fell to 11, a difference which was fully accounted for by the in-creased immersion of three feet. Her freeboard re-

Converted British three-decker "Royal Savereira changed to an all-big-gun battleship in 1862 WAS THIS THE PIRST " DREADWONDET!

mained at seven feet after conversion. The cost of

mained at awan feet after conversion. The cost of the work was \$428,500.

The "Royal Bowr.edgn." besides having been, at any rate, one of the prototypes of the modern 'Pread nought,' is interesting as having been the first vessel actually built in Bagained semboring these principles was the "Captain." an ironeland of 4,772 tons, which capshed in the Actual Proton of the Captain and the Captain. The contract of 4,772 tons, which capshed in the Actual Proton of the Captain and the Captain and Ca

three, both ships had 5½ inches of side armor in a rolled plate although up till then most American ships

had been armored on the inferior laminated system, both ships were practically markless, for the three peles of the "Royal Sovereign" reached only just above the top of the funnel In freeboard there was little e between the two, while in the met placing the turrets the British ship was decidedly

Much, therefore, as we owe to America in the de muon, mersore, as we owe to america in the de-velopment of modern navies, and more especially, per-haps, in the introduction of steam navigation and in the correct placing of turrets in modern battleships, I think it must be admitted that Great Britain was, the first to possess a prototype of the modern "Drund

nought."

I have been unable to procure a picture of the
"Royal Sovereign" for reproduction, but the accompanying elevation and plan will convey an idea of the
appearance of the ship.
It may be mentioned that Russia launched in 1867

It may be mentioned that Russia laumched in 1875 the "Admiral Laurent," a three-turreted tronclad of 5,754 tons, very similar in general design to the "Romonke." Bhe carried in sach torret two 15½-ton guns, but it was seen fit later to alter this to one 11-inch for each in view of the diagonal (or echelon) arrangement adopted in the British "Dreadnought" cruisers of the 'Invincible" type, it is interesting also to note that Italy ied the way with this system of mounting with the "Duitio" (1876), Great Britain following with the "Infexible" in 1881, and with four other ships a few years later The only American examples of this system of mounting were seen in the "Maine" and Texas," the first with two 10-inch and the second

'Tona,' the dirt with two 194mh at the second with one 184mh pun I nech terred.

The arrangement of the turres is the British Dreashought, had a protrippe in the French "Admiral Druperts," is suched in 1879. This ship had two turreis on the center line and on the same level aft, and a invest on each beam just forward of the fun node. The sums had a freeboard of 17 feet 5 linehes, siving them a great command of fire Each turrei contained one gun of 133 linehes caliber, and if another center-line turret he added forward of the two beam turres, it will be seen that the arrangement of the strange how often we are confronted with the fact, in reading of 10 books and other records, that there is "nothing new under the sum".

WORLDS OTHER SPAC

BY PROF. S. A. MITCHELL, COLUMBIA UNIVERSITY have systems around them possibly resembling our

Lave systems around them possibly resembling our own solar system, and it in nn outside the bounds of probability that many of the planets about these distant same may be inhabited by people who live and mave and think indeed, this earth of ours, of so much importance to us, is a most insignificant speck in the almost limitiess universe.

If one should look at the heavens on any clear moon less evening, he would see them shialing with countless orbs of light apparently millions in number—It is a fact that from our earliest education we have regarded the terms "numborless as the asnds of the sembore," and "countless as the stars," synonymous with quanti ties almost infinite, but if by the stars we mean those

that can be seen by the naked eye and the expression thousands of years before the invention of the telescope), our ideas have been ulterly at variance with the truth The un aided eye cannot monly supposed, nor yet hundreds of thousands for at any one time as could count only two to three thousand separate stars, and in whole heavens there are less than six thensand which can be seen with out a telescope. A

hill situated at about the center of the dam, and with in the excavation thus formed is now being laid the sleep concrete licering, the massive relating walls sleep contrate looring, the massive retaining walls and the place he were which will swing the gates for regulating the hight of the water in that great arifficial inland sea which will be formed by the dam it can readily be understood that the enomination

and expeditions laying of 8 une 000 colds yards of concrete in structures of this magnitude called for a spe-cial plant of great size and capacity. At Oston about 100 culde yards of concrete witt be emp The trushed store the sand and the coment for this concrete is handled to the following manner

crusted stone cours from Porto
Bello a small humbet about 26
mites east of Culon along the At-lantic count. The rock is taken
from the quarry by steam shovels and sent by gravity to the glant crushers, and though by gravity to the barges to the lurbor this point it is carried to Cristolal at the Albenth cutrance to the camat and thence era the old French changed, to rac docks at Gatun Here it is unloaded into storage hins by giant grate buckets, up r tween two sets of towers on ofther side of the channel

The sand is brought from Nom bre di Dios, about 40 miles along the coast from Colon It is taken from the sand pits by clamakell but kets, toured into sters purger and taken to Gatun, where it is un loaded by a process similar to that of unloading the crushed rock. The ement is now being shipped from New York At Calon the imment is transferred to barges and taken via the old From h channel to Gatun and unloaded to the storage yards

and unbased to the storage yards. The rock and and storage plots pards, while the have a spacety of about 200 000 cubit yards, while the have a spacety of about 200,000 barrols. From those storage buildings, the rock, and, and rement are delivered theories where to charging are running undermalls. These care, while are electrically operated, carry the naterials to the concept culty operated, carry the naterials to the concept mixing markines located mover the torker wite and discharge it direct to the machines. After the con-crete is mixed, it is dumped into huckets set on flat create is mixed, it is dumped into his kits set on fix cars, and the wars are run to position under the wide cableways spanning the locks' site and from three cableways the hinchest filled with concrete are nowing to position on the locks under construction. The general principles unow whith the plant at the locks on the Parific side is designed are it he same as those supplyord at Guiun, the unchanical details have

those employed at Gatun, the inechanical details have been varied to meet the local conditions. The latest report of the work, namely, that for De-cember last, shows that during the mouth the total work of excavation amounted to 2.618,682 cabic yards and that the total canal axesvation of all kinds amounted to \$,811 681 cubic yards. The material

placed in dams, mainly at the Gatun dam amounted to 340,610 cubic yards, and dir ing the month 57,265 cubic yards of constitution of the constitut

HALLEY'S COMET

Some interesting measures of Halley's comet, made with the micrometer of the Yerkes 40-inch refractor, are published by Prof Barnard in No 605 of the Astronomi error Harnard in No 500 or the Astronomic cal Journal With this large telescope the comet was quite an casy object, and the measures should be good, but, as Prof Barnard suggests, the edges of such a nebulous

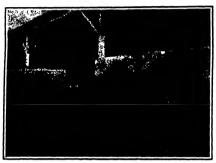

hody are not easy to set on The measures extend up to November 30th, 1909 when the estimated magnitude was about 110, and the comet showed a conden such tite, and the comet snowed a conden-sation of some 7 in hes diameter. The diam eter of the whole object was 41 inches, and possibly an lit-d-fined nucleus was seen, but this feature was very doubtful. From Sep-

this feature was very doubtful. From Sep-iember 17th to November 14th the measured diameters reduced to miles ranged from 15,400 to ' 200 miles the mean being 12,800 miles, or about 1½ times the cartha diameter

the December 1909 meeting of the Royal Antro nomical Society reported in No 418 of the Observa to: the Astronomer Royal ennounced that a photo-traph secured with the Reynolds reflector at Helwan, on August 24th shows the comot's image, its position spaces within 0 t2s in RA and 17 min in declination with the position alculated from the Cowell Crommelin orbit corrected by the Greenwith observa ilons. The Gorindod Gazes in Coal,

The occided states in Coal,
Prof 8 W Parr and Mr Perry larker of the lini
versity of littode have made an elaborate study of oc
cluded games in coal, which is published in a builetin
recently issued by the university As a result of their recently issued by the university. As a result of their work it seems that two active processes are set up immediately upon the liberation of the soal from the mainly constitute of manifest ("Ha, it he second is no absorption of oxygon. There can be little question, moreover, that the alterations proceed simultaneously. There are present in the games from all the anaptice of from drillings, notable quantities of medians, rang. ing from 18 per cent to 86 per cent of the various gas ing iron is pier out to so per cent or the various gas volumes. At the same time the oxygen present drops in a very positive manner, in some cases even reaching the vanishing point. That this transpiration of gases is interdependent and is of the nature of an osmotio exchange can hardly be affirmed as an explanation of

APPARENT PATH OF MALLEY'S COMET FROM JANUARY 6th TO

the phenomenon On the contrary, there seems to be evidence that the gases operate independently of each other

In the case of samples of marsh gas the exudation of CH, seems to have spent itself in those samples held in laboratory containers for two years. In no case is there evidence of further liberation of this asset in tones evicence or nurses: uncertaint of the vacuum An evicuation of the gases from two-pear-old samples shows no marnh gas present. The completion of this caudation would seem to be reached after two months, though it is well to note that by foreing, as with a vacuum, the two-months-old sample may be made to yield more methane, though in relatively small quantities. On the other hand, the avidity of the coal for oxygen seems to be pronounced at the very beginning of the exposure of the freshly-mined material, and while ... there are a number of cases where a certain agree-ment seems to exist between the in-going and the outgoing march was still there are more cases where the lon of oxygen is pronounced without any ovi dence of marsh gas being present. In all cases the oxygen nitrogen ratio shows a positive diminution of the oxygen from the normal ratio of approximately with practically no evidence of marsh gas being present it seems fair to conclude, for the present,

that there is no necessary connec-tion, at least of a strictly chemical nature, between the exudation of marsh gas and the absorption of

Again, the liberation of CH,, while very active in the first few while very active in the first few days after removal of the coal from the ground, diminishes in amount quite rapidly till, after the second onte rapidly till, after the second month, there is very little of this gas in evidence. The activity of the coal for exygen, on the con-trary, seems to be of longer dura-tion. Samples collected June ist, 1906, were tested in May and June 1906, were tested in May and June 1908 There is marked absorption of oxygen in the sample after two days' exposure in the flask to nor mai air, while in a second, with five days' exposure, a still furth nve days exposure, a suit turners reduction in the oxygen ratio without accompanying evidence, also, it should be noted, of marsh gas, was obtained A marked avidity for oxygen was shown after two years

oxygen was shown after two years from the time of collecting. These facts have a direct bearing in the topic of deterioration as sub-stantially defining the limit as to

time of that form of alteration mewhat in different coals, the loss of White varying se White varying semewhat in different coals, the loss of hydrocarbons for the most part it parallelly complete at the end of two months. These facts have a bearing also upon the matter of weathering, and indirectly upon the matter of a continuous combustion. The abortion of varying is undoubterly closely gasedated with both of these phenomens. The studies upon the weathering processes coincide with these studies in gases, assurely, that in all probability this now yope of gases, assurely, that in all probability this now yope of the processes of the continuous processes. Morrover, while under normal conditions there is of ted but a very slight oxidation and loss of fu values, the conditions are favorable, as, for example, for bringing about a very rapid combination with oxy

gou upon an increase of temperature

How far this absorption of oxygen is a chemical
reaction, or low combustion resulting in CO, and H,O,
and how far an absorption into the molecular structure and composition of coal must be left for study

In the Museum of the Louvre in Paris iles a collar of pearls at the point of death! Its death-bed is a plaque of velvet, and it is the large ned is a piaque of vertet, and it is the large collar that was part of the personal estate of Thiors and once belonged to his wife it is simply set and has no artistic value, its material value, however is estimated at \$60,000 It consists of 145 pears in three rows, the total weight of which is 2,007 grains, the total weight of waight is 3.509 grains, the three is reset pearls of the col far weighing 26, 39, and 51 grains respectively. This colar must "die", erery day it loses another degree of its luster, and in the course of the present decade it will become as dingy as a much-worn wreath of

> Why? Because pearls keep their incomparable sheen only when worn by women and come into habitual contact with the gentle, soft, and warm skin of the wes When, for instance, Queen Augusta died it was found that her magnificent strings of pearls were likewise in a persistent decline,

pears were likewise in a persistent cocline, and for the reason, indeed, that for many years she had not worn them on her bare neck (which fact was explained by her age) but only around the fabric of the neck of her watst. At that time a treat-ment of baths in sea-water was prescribed for them

most of baths in set-water was prescribed for them by exports, and for several months, nader obvious necessary preciations, they were suph into the sea and thus recovered their old tuster When, for instance, a collar of pasts is taken from the needs, where, subject to a temperature of 40 deg C approximately it has lain for hours, end is laid apon its marble plate of the dresser, which is perhaps only 20 deg. C warm, it feets, so to spe (Concluded as page 172.)

meteor that fell west of Corrington, North Dakots, on meteor that fell west of Corrington, North Dakota, on January 10th. It was seen for seventy miles south of Streeter, North Dakota and passed over us with great speed. It buried itself six feet in the ground about seventy miles north of Streeter The heat pro-duced was so great that for forty-eight hours no one duced was so great that for forty-eight hours no one could approach it closely notwithstanding the fact that the ground was covered with amov and was frome to a depth of four feet. When the meteor passed over our heads from a southwesterly direction to northheat. It shope most hrillinatity. The noise which it produced can be littened only to that of a very large cannon ball in flight. The diameter of the noteor is of inclus. It has been taken out and sent to Blumarck Streeter, N D

SOME STRANGE ANIMAL INSTINCTS.

To the Editor of the Scientific American

To the Editor of the SURTINI AMERICAN
Two items in your science column of January 8th,
1810, interest me That about the return home of the
litten and cat because there are scientists in you
own city and showhere who have held deggodly that own city and elsewhere who have held dogardly that the special seaso of this nonderid ability to go back home is not a special as now but the result of some sort of observation, although the cat may be blind folded. They even claim that homing piecons find their way back by observing the lit of the country. While this instinct is by no means surering, and to developed to a runth greater existent its sense individ developed to a runth greater existent its sense individ uals than in others, there seems no justification of the donial to these lower crustures of a faculty of orien donial to these lower creatures of a faculty of orical lation or traversing which man possesses in only a small degre. There are many instances where the return has been made over a route very different from that of the outgoing journey and could not have been influenced by the topography, even if it could have been ubserved

The other instance is that of the magpio which was fond of rubbing tobacco and its ashes into its plumage as mentioned by the writer in Kosmos. This is of special interest to me because I had made a similar observation on a hinejay—a relative of the magplo-and had never so far been able to confirm it from and nad never so har been able to contribute any other source Fortunately as long ago as 1886 I recorded it in my little book "The Story of the Birds" (Appleton) from which I venture to quote

"I saw him (the jay) engaged in the wainut tree one day in late summer in a manner that made me fear that his bath had not been sufficiently effectual He would pluck off a leaf, lift his wing and rub it into He would place of a leaf, lift his wing and rub it into his pinman i saw him do it repeatedly, and are saw and trose have a puspent odor and are disagreeable to insects, if feared that he had some guests had were trying to get rid of If this theory should be correct here was a case of a blief using period with at least good intentions." (Fugo 243) II is well known that does and other manmais will rub their bodies into ur against something that is strikingly doctons, for the sake of the perfume of a strikingly doctons, for the sake of the perfume only in which they seem to delight, but those two are the only instances that I know of where hirds are the

in which they seem to designt; out touse to an too only instances that I know of where hirds are re-corded as doing the same. It would be interesting to hear from any other instances—if there are any, as is likely James Newton Bassery

RE-ARMING OUR WARRIES.

To the Editor of the SCIENTIFIC AMERICAN

In a tetter to the SCHENTIFIC AMERICAN of September 5th, 1908, a correspondent, Mr A. B. Wingfield, sug-gested the rearming of our "Cooncoticut" class of battieships with four 12-inch guns in place of the eight 8-inch that are now carried in the main battery of this Sinch that are now carried in the mann naturey or that type. The Bidfort's comment at the time was that the greater weight of 12-inch gun emplacements on the beam would necessitate too costly structural strength onings to justify the change, that the 4-inch armor protection would be too light for these emplas ments,

and that the increase in dead weight would sink the aiready low armor belt avon fewer in the water A previous letter appeared in your issue of August 15th, 1908, and since then changes of title character have

I know that if the SCIENTIFIC AMERICAN takes up this matter, its influe nee will be brought to bear on navai men, the object in view, of course, being to make dreadnoughts of the "Connecticat' type and wemi-dreadnoughts of the 'Georgia' class. The younger officers in the navy whom I have questioned in regard to this matter are manimously in favor of these im movements

As armed at present, the "Connecticut' and "Geo: gia' classes are not as efficient as a comparatively gis classes are not as efficient as a comparative mail additional expense could make them, and in view of the conceded superfortly of the fall hig gas type of ship, if seems worth while to consider how it would be possible to so reconstruct the above type as to make them more formulable against dreadoughts. The pre-eminent function of a battleship is to constitute the greatest efficiency and power possible in a nigite vessel. The armanent of the "Connecticut"

a single vessel The armament of the "connecticutions consists of four 12-line leght 8 inch, 12 7-lineh, and twenty 3 inch, of which four 12's, four 8's, six 7's and eight 3s can fire on broadside The "Georgia" type mounts four 12 inch, eight 8-linch, twire 6-linch, and twelve 3 inch, of which four 12's eix 8's, six 6 s, and six 3's fire on broadside. Now to convert these ships to dreadnoughts it would be necessary to mount one 12 inch gun in pince of the two 8s in each of the beam turrets keeping the emplacements as they are

beam turreds keeping the emplacements as they are As the 7 livel guns are too amall for battle ranges and too slow for turpe do defense they could be sub-stituted by the 5-linel rapid fires which are now being mounted on all our new dreadnoughls. With say registern of these and a few more 3 pounders in place of the present twenty 3 inch gaus, the change is com-plete and you have a vessel the equal of the "Michican't you which are really nowerful dreadnoughts on cticut, qinbjuccus ut

In the "Georgia' class the same remuvat he made, except that the four superposed 8's would have to be retained and the six additional 5's omitted have to be retained and the six additional is emitted. The 'idaho', and 'Mississippi' could be similarly treated. Under this arrangement the armanesi of the two classes would now be 'Connected' eight 12 inch and eighteen felich with a breadside fire of six 12s and time is "Georgia" six 12 lisel, four 8 inch, and twelve 6-inch with a breadside fire of five 12s, and twelve o-inch with a brandsidu into ot ave 12s, four 8s, and six 5s. Then our two. 'Idahas, four 'Georgias," six "Connecticuls" two "Michigans" and two "Delawarva" would mount 124 12 inch gums in stead of 84 as at present, and would practically be a dreadness t fleet. The benefits from these chauses are as follows

- A homogeneous broadaide giving greater con centration of fire at battle ranges
- 2 A simpler system of spotting and fire control, with unity one range to get and only one caliber of gun (excepting the four "Georgias") in the main bat
- A greater efficiency of ordinance resulting from uniformity in ammunition and conse more united
- or organization for and the quicker deliv ery of shell
- й An opportunity offered to hold former 7 luch gun crews in r serve for turnet crews The c instraction of unwieldy and innecurate mid
- die hatteries with large crews necessary to their serv ire in exposed positions
 7 A smaller number of mon in action at the
- time and behind heavier armor (Le, turrets only) at
- battle ranges
 8 An increase in the efficiency of torpedo defense
 1 and the object of t by a gun more practicable in every way than the ok caliber, which was ineffective at 3 500 yards and re
- caller, which was inspective at 3 years and re-quired the same number of men to handle it 9 The lightening of the armor bett and hringing 10 The placing of the ontire main battery behind

Now as to the cost For one battleship of the necticut" class to be improved as shown above, the ex-pense would consist chiefly of the price of four 12 inch and eighteen 5-inch rifles, and the remodeling of the Sinch turrets and handling roome The 5-inch guns Sinch turrets and handling roome The 5-inch guns could occupy positions behind the old 7 inch barbettes, on the gun deck the 3 inch casements (alightly en-targed) on the main deck and new mounts for the superstructure I do not believe that the structural part of the ship would need strengthening in any way Moreover, all these discarded eights, sevens, sixes, and es could be mounted on smaller cruisers, where they could do the work required of them, and thus

oney on new construction could be saved.

I think that you will agree with me in saying that the these improvements made our pre-dreadnought. with the type will not only possess far greater efficiency than they do now, but also that they will be able to stand

in the first line of battle with future dreads The real question is this. In the greater efficiency worth its cost? In view of the slight difference in the cost of maintaining to commission a "Connect cut" and a "Delaware," I think it is and the Scryttic American can do a lot toward making these paper changes realities. Brooklyn, N Y HAROLD M. KENNER

publishing this interesting study in publishing this interesting with or a mich mooted question, we would point out that it seems to be the unanimous opinion of oaval men in all cavies that the re-arming of the older ships does not pay,

that it is programing or its of our saips more inc. is a.y.
that all appropriations for construction should be put
into new ships. Such changes as are suggested above
would involve enormously costly siructural work on
the huits. There is no room for 12 inch guins in the

The New Supplement tutalogue

The publishers of the Scientific American have issued a new catalogue of the Scientific American Supplement in which 20,000 articles are listed Many of these articles have been translated from foreign of these articles have been translated from foreign publications which are ordinarily inaccessible to Eng-liab-speaking readers. Many of them also are papers read before the incrine discolates societies of the world and accessible only in a few large public libraries. The articles are all carefully inferred so that the information on any particular scientific subject may be found in a few minists. The catalogue will be sent graturiously to all who apply for it

The inundation of Paris made many of the streets of that metropolis as navigable as the canals of Venice. The highest point reached by the water was 31 feet. I inches above the normal at the Pout Royal Not. since the historic flood of 1615 has Paris been visited. hy such an inutuation. On January 29th the waters began to fall, and the city for the first time began to feel safa Even as it was, the Heine was swollen to thirty times its ordinary volume and the current raced thirty times its ordinary volume and the current need to the sex tweety times faster than usual. The banks have been overflowed for from half a mite to a mile on either side. That was and wonderful sewer system which figures so dramatically in Victor lingo's 'less Miserables and which has been dwelt upon time of the miles of the side of the catastropic They served as conduits for the food liuge as they are, they were unable to cope with the indee as they are, they were under to copie with the infibilius waters. Pavent its were present upward, and the water bubbled up into the streets. Apprehension was felt for the safety of the monunicities of the Trench capital, an apprehension which is not yet stilled it seemed attackt certain that their foundations would be sapped. It speaks well for the work of French engineers that none of the twenty four bridges Freuin engineers that none of the twoult your prices that span the Schie was carried away, and that it was found necessary to tone but eight of them. On the other hand, these bridges undoubtedly helped to dam the waters and to aid in the tilty s hundration. It apseaks well for the architects and masons of the middle ages that the famous Cathudrai of Notre lame.

should have stood in a lake for days and days without should have stood in a lake for days and days without autforing injury Many of the historic buildings of Paris were flooded, but fortunately the art treasures seem all to have been preserved with little or no linjury When the saturated ground dries out and con-Hilling When the saturated ground arrive out and com-tracts, it may be that some of the hulldings will settle and possibly collapse The Louvre, although flooded, was still able to serve its function of housing its price-less valuatings and its statutes. The great above could

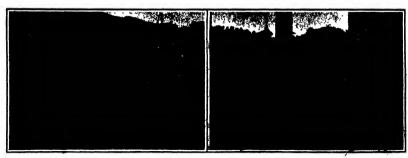

was still able to serve lis function of bounds its priva-less valshings and its statuse. The great shops could not be queed on account of the water. The fanous relative Francis still gave its performances, but it used candice as it did back in the days of Moliter It was but intured that the Chamber of Deputies should have continued its assains a neithblitto of right on the part of the legislators would undoubtedly have height-oned the public teror. As it was, the numbers were derried arross the square to the cham-

members were ferried across the square to the cham-bor The old Latin Quarter and the Champ do Mars, the Rues Royale, the Roulevard Haussman, the Place do in Concrote, the Champs Elysele were awamped Naturally the subways nuffered heavily Only the Gree du Norde seems to have example. The station of St. Lazaro seems to have example. The station of St. Lazaro seems to have example. The station of the way to be suffered most awards and the station of the way to be suffered to the station of the stat It was, the suburban traffic was entirely cut off, as that the sparing of the care dis Nord served simply to give the frightened sepates a place of questionable give the frightened sepates a place of questionable that is the server (the theme of many a thritting French short slowy) and of the baseman and sub-cellars of Farls were able to seeaps. Suburban towns 19ting somewhat tower than the city have suffered The hereaking of a dyke completely inundated Gennavilliers. Its community of 10,000 per-

driven out by ten feet of water

Paris may now be considered safe from water, but
the danger from sickness still prevails. The steach the tanger from sickness still prevaits. The steatch of the stagnant water and of the drowned animals will undountedly continue for days. The Paris health authorities will find difficulty in coping with that altuation

authorities will find difficulty in coping with that attuation. The actual cause of the flood has not been fully revealed floon explain it geologically by arruing that will winter, characterized by beavy rains and ittie theory to await the lawstigation of the municipal captions. Only when the floods have subsided and a careful examination can be made, will the full measure of the disaster be assertained. The accounts of brareful as well as the subsided and a careful examination can be made, will the full measure of the disaster be assertained. The accounts of brareful as well as the subsequent of the flood have been sufficiently dis usued in our editorial of February 8th. For that reason the results of this Paristan intendation of the flood have been sufficiently dis usued in our editorial of February 8th. For that reason the results of this Paristan intendation either the channel of the Select must be widness of either the channel of the Select must be widness of either the channel of the Select must be widness of either the channel of the Select must be widness or either the channel of the Select must be widness or exited a waterway around the city, a waterway which will serve the purpose of disturding the surplus of the Select in time of food and of discharging it below the city.

The conductors of Paris.

A cart-ferry to one of the stre

The total area of the peat bogs and moors of Germany is more than 3,000 square miles, of which about two-fifths are situated in Hanovar and Schleswig-Holstein. The Prussian government possesses in East Prissland nearly 40,000 acres of upland moors, of which about 16,000 acres, known as the Anrich, or Priedeburg bogs, have for some years been the acene on with great skill and energy, though infortunately with a degree of secrecy which makes it difficult to assertain the exact facts, sithough the undertaking is assertant the exact facts, although the undertaking is of the graphet and most general importance it is contemplated not only to reclaim the moors for cultivation and nettlement, but also to make them the source; of energy which

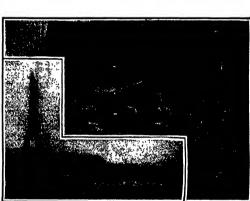

at a property wants at her light and power the transferred in region thirty that a spitus of thirty that Martin ight, thus d. M. already suphaven ned several other es said towns, and large antities of ammonia, hy-agen suiphide, and other scous products are sold use in various indusreclaimed lies between the Ems-Jahde canal on the north and the Nordgeorge-sehn canal on the south, between which a connectcanal will be con connect the system with the canals of the older moor enlantes to the west ward. In all, 38 miles of new canals will be re-quired. Their construc-tion will necessitate the stripping of about 650 of moor, from which it is estimated that nearly 350 million cubic feet of ŭ peat will be obtained work were done by the old Dutch mothed, the ls would not be fin-

ished in several decades, during which period the price sased in several decades, during which period the price of peat, already very low in this district, would con-tinue to ducline Both of these difficulties were avoided simultaneously by the adoption of cleerical methods, by which the work of excavation is carried on very rapidly and supplies its own fuel In the center of the moor is a boiler plant, which consumes pea exclusively The problem of course, will be still more simplified when a method of producing electricity di-rectly from heat is developed

The first settlers established on the Friedehi The inst sources established on the Freedening moof will carry on what is known as surface cultivation, and will at the same time gather peat, which they will sell to the electrical company, the charter of which runs for seventy five years. As the high moor is thus cut down the method of cultivation will be gradually changed to that which is employed in the low-lying of Holland

All of the energy is supplied from the central power tation of the Siemens-Schnekert Company, situated

on an island in the bog at the intersection of two main roads. From this point wires, supported by poles, radiate in all directions, supplying light and power to the whole country for many miles around The main canal is bordered by soveral rows of poles and wires, one for the telephone, another for the peat digging and agricultural machinery, a third for the high-teasion alternating-current long-distance service Current was to be supplied to the surrounding cities in November of this year. The station is soutpose with two steam turbines of 1,300 horse power each The great plows used for the excavation of the canada have long been driven by electricity. The past dis-sach day is compressed by electric precesse into 4,500 hicks, which when dry are used as fael in the central high-tension alternating-current long-distance service

Scenes from the great Paris flood.

station In the gas generators 40,000 cubic feet of fuel station In the gas graculary 40,000 cubic fact of fuel gas and 30 pounds of ammonium sulphate are obtained from 100 pounds of peat. The combustion of this quantity of fuel gas grain rates 273 horse power hours of energy, while the safe of the ammonia compounds pays a good interest on the capital invested. Con tracts for supplying light and power to most of the tracts for supplying light and power to most of the surrounding towns and cities have aiready been signed. The duration of the contract in most cases is forty years, while the charter of the Siemens Schuck ort Company will remain in force seventy five years The area assigned for cultivation and settlement com The arm, assigned for cultivation and settlement com-prises about 17000 acres The digging of the canal requires the peat to be removed from a strip about 150 feet wide, so that the construction of the 15 miles of canal will invoice the stripping of 500 acres. The average depth of the peat is 11½ feet. Deducting the superficial airctum of 70 inches, which is compare tively worthises the disging of all the canals will about 247 million cubic feet of peat, which

when dried will furnish 1.1/3 million tone of fuel post This amount of fuel sione would supply the central station, producing five million kilowatt hours of en sixty-six years On each side of each canal, a strin 165 feet wide is to be cleared of post for cuitivation and settlement. The peat thus obtained, added to that obtained from the canals, would enable the capacity of the station for the duration of its charter be trir

An idea of the cost of the electric light and power thus furnished may be gained from the contract re-contly concluded with the town of Baut, in which the of lighting current is fixed at about 10 cents and that of power current at 5 cents, per kilowatt hour At these rates a 16-candle carbon incandescent

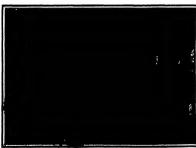

lamp or a 40-candle metal filament lamp would cost about 12 cent per hour and an arc lamp from 2 to 8% cents per hour ac-cording to its candle power Thus the Friede hurg bogs are to be util-ised as a field for colonisation as a suprem of tight r the surrounding coun try within a radius of 30 miles, and as a cheap and reliable source of power for all the cities and farm East Friesland. though all the hopes which have been built on the en terprise may not be ful filled, it is already certain that the recisionation and cultivation of bog land has entered upon a new and promising stage of de velopment in consequence of this application of elec-tricity. It must be admit ted however, that on the Friedehurg moor the con ditions for reclamation ditions for reclamation are especially favorable The land is in general level, and it has already been superficially dried and smoothed by hurning moor are already bordered

with rankly-growing grass

Industrial Chimneys and Water Towers of Concrete Blocks

BY H. PRIME KIEFFER

The employment of concrete blocks for the construction of factory or industrial chimness and water low ers is one of the most mand use of that new form some some or tree gives matter to use of that the defent of utilizing separately modeled blocks for this per passe should have come from kayage look of Amer les where thooks here found a wider range of use than in any country in the world. The wistern is the then in any country in the worm. The exacts is the that one for the supplier could be factory commerce in the United States there have been in use some techny different systems in which armored control is employed but they all have some primary form of scarfolding in their designs. This is the underlying scaffolding in their designs. This is the underlying reason why those chinneys cannot be constructed once economically and rapidly. The nethod of constructing chinness of separate model of our rich blocks is the overallon of M. Dunnas, an engineer and medited of trusse he is lightness. ct Pils also of Harsa is who furnished the data and plattographs for the present article. The system is notable for its samplicity its hearts of furni its econ only in cost, and its adaptability to rapid construction

The chimness on 1th all others in that they are tounned of three pasts the foundation the base and the shaft. The shaft is formed of reinforced tour rete

of a special design. The form of the blocks is shown in the accompanying dia gram. The number of blocks in each course al ways remains the same, yet there is a taper to the chimney They are placed in regular horizontal courses to the required height and upon the log is placed a special capping block of either concrete cast from or cut slone The builders work on a rough platform and from

the interior of the structure and each block is re colved by them ready for its particular position Two men are usually em played above in laying the blocks, and two below to holst them to the platform The blocks in each suc The blocks in each sic coulding course are placed in the opposite direction, that is to say, all the even courses will have the same direction and all the odd direction and all the odd courses will take the re-verse of little in this man-ner, the joining of the blocks of one course where they do not meet perfectly will be covered by the blocks in the course by the blocks in the tourse above As shown in the diagram each block has at one of its extremities, a 'hook' similar to the shape of the letter 'II'. This "hook" forms a hollow span which ex-tends the full length of the chimney and of course there will be just as many of these hollow spa or these hollow spaces as there are sides to the chimney. Through these vertical hollow spaces are placed vertical from rods B, varying in dismeter ac cording to the height of cording to the negative the structure. At each course these rods are tied or bound to the courses by Ushaped flat from your bound to the courses by Ushaped flat from your bound to the courses by Ushaped flat from your bound.

These in turn, are wired to a small fron red
D which is placed between the courses borizontally
and in a grows made for it in the top of the blocks.

The plucing of the virtical rods in the eponings

and not in the substance of the shaft proper forms an important advantage of this system. The rein forcement is thus kept at a low temperature, and is not subject to the injurious effects which would arise nor subject to the injurious where where would arrise from the qual expansion if the steel was in the cen-ter of the mass. Ferro one rit is infertructible by fire so long as the temperature of decomposition of courrete is not reached but it must be remembered. that allimigh the coefficients of expansion of cement are the same, the coefficients of conductibility are

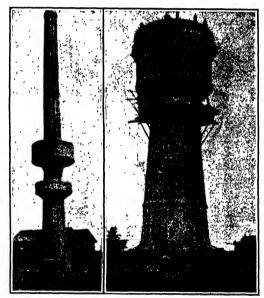

very different, and fracture is likely to arise if, from this cause, the temperature of the iron exceeds that of the concrete Consideration of this condition is espe important in the case of a structu heated on one side only, such as a chimney

A clever idea in connection with the design of the blocks is that there is need for only three, or at the ost, four sizes of blocks for the average chimney of

INDUSTRIAL CHIMNEYS AND WATER TOWERS OF CONCRETE BLOCKS.

150 feet high and with a taper of one to three per cent This is made possible by the following arrangement
The model by which the blocks are made con
sist of but three cast-iron plates, held together by
wooden stop blocks, and three ordinary iron clamps
Different sizes of blocks can be made therefore, by Different sless of blocks can be made therefore, by simply changing the relative positions of the plates and the wooden slop blocks. After the blocks are moised, they are placed in the following manner Take, for instance, the first row, at the block strend naturally the block are of the largust size, and the arm of the block in the longset. The arms of the blocks of the block are of the edge of the blocks of the block as did in the extreme the arms are placed just as little ratther block the blocks, and this placed just as little ratther block be blocks, and this

onch stoccooling course has a diameter smaller than the one below it, and in this manner, the taper of the chimney is obtained. As the longest belosis are some three feet in length and the distance across the seni-irrelate opening about site to eight inches, it is possible to make a considerable toper in this manner. For its changed every frest or fifty freed. The bloods may, of course, be laid with absolutely no isper, and then one size, only, of thocks is used. Some spikeneys have been constructed on this plan, but their appearance in not no generalize at these harders, and the superance of the control of the co

in the same district. The proportions for the commixture vary somewhat, but the usual mixture sists of about five parts gravel, three of sand, and two of coment. Dust of stone is used sometimes, and has given very good results. From an archimetural point given very good results. From an archimetural point.

\(\tilde{\text{view}}, \there \text{chinucys} \) econstructed with this system
present a pleasing appearance Being thinner than
\(\text{view}, \text{they rise} \) more gracefully from their
\(\text{lames}, \text{and yet the strength and stability which they

h and stability which they actually possessib at once suggested to the eye by the appearance of strength which is presented by the protrading rounded angles. A number of oldnings; and water towers have been built in Europe after this system, and the two photographs presented in connection with this arti-cle show a water tower. connection with this arti-cle show a water tower, and a combined water lower and chimnay. The water tower which is lo-cated in Urele, a suburb of Hrussels Heigium, will be used in connection with the 1910 exposition to be held in that city The tower and tank have a height of 145 feet and initer has a capacity of 280,000 gailons The struc-ture is circuiar and is built entirely of concrete blocks and without mold ing of any kind excepting that need in the building of the concreto reinforcing struts surrounding the base of the tank proper The inside of the tank is inclinate of the tank is stories connected by a winding stairway. These different floors are divided into rooms which will all be occupied by engineers, foremen and other work men during the exposition The stairways are placed along the outer walls and the water remains in the center inclosed by a con crete covering of square

Oil That Cold Will Ret Affect.

It is often difficult to keep machinery properly oiled in cold weather, as

Belgium. olled in cold weather, as the oil freeze in the oil belgium. Office.

Office. Office.

In his presidential address to the America In his presidential address to the American Street and Intervalvan Rallway Association, Mr Shaw, at Donver, said that is round numbers there are 1.250 street and intervalvan rallway companies in America, with a total of 35 900 miles of single-track and 75,000 passenger cars. The passenger carried annually in 19,000,000, and the green income \$44,000,000.

THE CONSTRUCTION OF AN IMPROVED SILICON DETECTOR ST 41

The detector described here is one that can easily The detector described here is one that can easily take the name 'improved', being a radical departure from the coarsely-adjusted detectors generally used if properly constructed and connected, it will easily pick up wireless messages sout from very distant points. The component parts are shown in Fig. 1

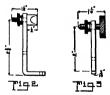

se of the instrument is fashioned from hard rubber, 3 x 2 x ½ inches, ½ inch beles are bored in it one inch from either and A support for the expetal cup is made from annealed brass, 4 inches in length ", inch in width, and 3/16 inch in thicke bent to an L shape, as can be seen in Fig 2

The crystal cup is turned from brass rod 1/2 inch in diameter it is ihreaded, as seen in Figs 1 and 2, to fit a thumb nut. The crystal is fastened in the cup by means of lead. This insures a good contact. The ad

Tiq. I SPOTTOWAL VIYW OF THE ASSESSMENT DETECTOR.

justing mechanism can be made to move a steel hair suiral, the point of which makes contact on the silicon to the thousandth part of an inch. The phosphor bronze strip upon which the suital contact is fastened is 3 inches in longth, 1/2 inch in width, of No 28 B & S gage sheet it is boiled to a cabe of brass which in gage shiet It is boiled to a line of brass which in lura is fastened by means of a machine acree to the lease. This stree acrees also as a binding post. The brass not supporting the adjusting scree is of 3/16 inch brass of the same stock as the Lubaped post II is 2½ inches in longith, % inch in width, and 3/16 inch in thickness. A ½-inch hole is borred ½ inch from

SUPPORTS FOR THE CRYSTAL AND THE ADJUSTING

one end to admit the machine screw that hinds it to th hrass cube Another hole is hored 1/2 Inch from the other end and tapped to fit the adjusting screw. The adjusting screw has a large knowled rubber handle for adjusting purposes, also a lock nut to be tightened when the detector is at its most sensitive point

This detector is comparatively easy to construct and is inexpensive. The one undesirable quality in silicon is inexpensive The one undesirable quality in siliron detectors—their ability to get out of adjustment—is almost antirely eliminated in this detector, due to the use of the spiral instead of the solid contact

INCREASING THE EFFICIENCY OF WIMSEVEST BLECTRIC MACRINES. BY GROSES J BURDOUS

The Wimshurst static electric machine, as is well known, consists of two glass i freies revolving on a com-pound axis in opopult directions. As usually made, this machine is inferior to the Toepler-Holtz type, al this machine is interior to the temperature type, as though somewhat cheaper to make, and superior in simplicity. The latter quality has been without doubt one of the chief reasons why it is in general use wherever the small electric discharge this machine will give as commonly made, will answer the purpose. In building both kinds of these interesting ma

chines it is the practice to varnish the revolving gi circles with white shelias dissolved in alcohol. In the higher grade machines the best quality of sheliac and grain alcohol are used for this varnish buffer the toy grain alrobol are used for this warnish but for the toy variety would alcohol and the cheapest grades of shellar are used. Some years ago the writer was building both Whushurat and Toopher Holtz sixties, but was un-able to obtain a discharge from the Winnahurst 19je that (ould compare with the other kind, even when the glass circles were of the same diameter The development of the machines in both cases had

extended over a series of years, and it was supposed the limit was reached. At this time the Toepler Holtz the timit was reashed. At this time the To-epter Hoffs muchines were giving with 26 inth tircles aparks unding the Leyden Jara) equal to the radius of the circles or 13 inclus long thick as the thumb and when discharging deforating like the sound of a rife

The Winshurst machines with an equally large cir-le would not give sparks over 4 inches long, and about as thick as a knitting needle Finally, in building a lot of alx machines it was found some were much bet ter than others. Strengous efforts were made to ascer ed the increase in officery hat witho discovering anything different in the construction of those that showed the improvement from the others those that showed the improvement from the others in the noxt lot after this, however, all of the mashines were capable of giving sparks 6 inches long, nithough the diameter of the glass circles was but 14 inches The thickness of the spark had also increased to the size of a pipe stem and this wanderful increase of officiency was altributed to some quality inherent in the glass of which the circles were made but inquiries made of the manufacturers of the glass failed to disany different methods of making the glass than lad been followed for many years
About this time the writer in varnishing s

tes held one of them up to the light and was struck by its light green apparame and although giving it little attention at the time gained the impression that this change in color might have something to do with the increased efficiency still unaccounted for after this a now lot of machines were built and every one of them had reverted to first principles so far as the spark was rouvered it being short week, and spindling in the effort to find out what had consent the reversion the writer called to mind that just be fore varnishing the last lat a new brush had been use in a new batch of varnish

il is rustiquary in making the varuish to disthe shellac gum in a glass jar with a mouth ju crough to get the brush in conveniently and the brush is left in the jar between the construction of the differ ant tota of machines. It was found that the old brush had las n shedding its bristies, and to prevent this had been bound around with some fine copper wire The action of the varnish had been to correde the cop-per and the salt had given the varnish the faint green color noticed some time before on the glass of cles, although there had been nothing different in the

edor of the lody of varnish in the jar apparent.
The suspicion dawned on the mind of the write that this had been the cause of the increase of efficiency and the tack of it in the tast tel of machines. Anothe batch of varnish was accordingly made, and in it was put about a quarier of a poind of fine bare copper wire. A new brush was procured and placed in the jar and the varnish allowed to stand in a warm room about a week, when it had assumed a light green color, and was used to coat the circles of a ne

chine This machine was found on trial to be even mor-

efficient than the best of the others in experimenting with the newly discovered varnish it was found that if il was allowed to become a dark green the vottage of the machine was interfered with and while the spark would be thicker it would not jump as far. The best results were obtained who the color was a very light green. The reason for the in creased efficiency was thought in be due to a decrease of the resistance of the shelts; between the sectors on which the equalizing brushes boar

which the equalizing brushes bear This variable was tried on Toeplev-Holts machines without their shosing any marked increase perhaps due to their being air ady capable of delivering sparks equal to the radius of the giams circles

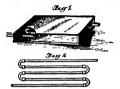

The use of varnish made in this way will be found The use of varsish made in this way will be fooled by amateurs and others to add greatly to the capabili-ties of the Wimshirst ma bine, and besides the light green color on the glass sides to the beauty of the in

Many builders of Wimshurst machines as well as one experimentally inclined have trouble in making to brass sectors atick to the shellar. As tinfoll soon wears through from contact with the equaliser brus weens through room contact with the equatine runsing, thin sheet brans is used by many on the better grades of machines to secure durability. Brans sectors can be made to sick permanently in the following manner. In variabing the trevies about three coats is gon erally applied with a large flat camel's hair brush

Each coat is allowed to become motorately hard be-fore applying the next. After the last coat is ap-plied, and has stood about lifteen minutes mark the ocations where the sectors are to go (they sh evenly seacod), and after apply tog some varnish to the under side of the sector, press it down into the soft varnish until a slight ring swells up around the murgin of the sector After the varnish is hard an examina from which it will never separate as it wilt if cenemical in any other way on account of the expansion and con ractions of the brass being so much greater than the glass, and causing the sector to become loose

SILVERING GLASS AT HOME.

A good gloss infree made with one a own hands is a thing to be proud of Mirrors are now seldom nonde-by the third and more are process because of the dimerrors character of the work but pure after to The ellier process is not in the least dangerous to the workman. The formula here given is one that has been in use in several looking glass and art mirror factories in the city of London

APPARATUS PROTURED FOR SILVERING GLASS.

thembals used must be of absolute purity (chemically pure) and all operations in preparing the glass must be carried out with care and scrupulous cleanliness rises to be alliered must not be proused upon by the fingers or thumbs they would leave an indelible

The first thing to be done to be make a The first thing to be done is in make a sinci i cause out of a piece of salar about \(^2\), or \(^2\) In int thick 10 or 12 inches wide and 18 inches long. These measurements are not bludding, any piece of sist is lead the above size will do A wood in trough must be made. above size will do A wonden trough unust be under with groovers at the tup-rejax for the slat slab to rest. In There must be a space of 2 inches between the state slab to bit, woods abottom as indistated in Fig. 2. In this space, is a cell of pipe arrange d as shown in Fig. 2. The pipe lost slates! No the howe and through Fig. 2. The pipe lost slates! No the how and through slate slate to slates! No fig. 2 in the lost of the slate slate to slates! No fig. 2 in fact just had except for the hand to lear. The states can be supplied from an ordinary fea kells placed near the dequaliting table with a rubbe r tube connecting the cell to the apost of with a rubber tube connecting the coil to the spout of the kettle. Uniform heating of the siste siab is essential. The coll can be easily made of ¼ inch from gas piping screwed into Ushaped east from connectors, as iquing screwed into Usinged east from connectors, as shown in Fig. 2. The slati slab can be covered with black olicioth and made scrivetty level. The following crock solutions must be made up and carefully fillered through absorbent collan ready for use

Slock Solution A - Nitrate of silver 3 oun tilled water 10 onness strong water ammonia 12% onness. This solution must be stirred well and allowed to stand five or six hours, then add to onness. e of distilled water and titler

Block Solution it—Restricts saits 4 ounces, distilled unfor 20 ounces

Stock Solution 1' Distilled water 40 ounces, protochioride of the 5 gratus

Ctean the glass plate or plates whitevery time rouge and water laking our tind on trace of grouse whatso ever comes into contact with the glass or the cloths or chamois leather used for polishing. When channed the plate must be flooded all over with the the solution Pour this solution on and wash the plate well with district water Lax the plate we take up upon the table with four clean wood wedges at ante corner Let the gloss cost me the wedges as as to allow a slight adjustment. It resulted for leveling. The intx ture for silvering is made up as follows

Distilled water 20 outces stock solution B is The glass plate being quits fevel and still well pour this mixture carefully and slowly upon the cen ter it will flow comby all over until it strads about one-eighth of an toch deep att over the plate. Any tendence in run to one end must be rectified by the The plate now being completely covered with the silvering infaire must be left to the if for about two hours the heat being kept up during this line and when it is found that the whole of the silver has satted the liquid must be poured off by tilting and allowed to run into a stoneway, crock and saved Scientific American

for the waste silver it contains. If it is desired to for the waste silver it contains. If it is desired to increase the thickness of the deposit of silver, the op-eration must be repeated as soon as the silvering is complete, wash the plate well in a soft stream of runstand it cornerwise to drain and When dry the following protective varnish must be used as a coating to preject the deposited silver. Shell iac. % pound, wood slephol, 6 pints. As soon as this iac, ½ pound, wood alcohol, 6 joints As soon as this conting itse first it must be paint; dower again with the following paint. Red lend ½ pound, white lead, ½ pound, instead with second holid oil and a small quantity of turns all no to take a good to sering with a single conting. A small quantity of gold size must also be dided to insure quick drying and a tough adhering quality. The mirror is now ready for framing if much work has to be done, it will be advisable to cover the siste all over with a piece of felt, and keep the felt wet during the operation for two reasons plate, and secondly, the heat from the state slab to communicated to the glass better than from a dry sur-

regular workshop a vory go fort with a guiter cut around the slab, so that the spent silvering liquid out run from the tilted plate, spent survering inputs on run from the fitted paids, around the table and be collected by renaling through a hole at one owner in this case the liquid will be sume that one incented with the felt. This will prove of no consequence because in time it will become asterizated with silver, which will realize twenty times its first cost when sent to the silver reflere, and not only my for a new felt covering, but increase the size of the pocket book at the same time. The quantity of nitrate of silver required to cost a square foot of glass with a moderate roating of silver is 18 grains. An estimate as to cost can be made from this amount

SELENIUM ORLL WITH CONTACT BY PREMURE

The usual method of making a scienium cell con wisis in pressing the electrodes against a please of electric current, when submitted to the action of the The quality of selenium can be perfectly con light The quality of scientum can be perfectly con-teiled, as it needs not come in contact with metal when fluid in which state it dissolves nearly all metals (1 c, the electrodes). This is of importance, because small quantities of other clomonia sometimes have considerable influence on its sensitivoness. More over a piece of seienium, that for some reason has lost list efficiency, can be exally replaced by another piece, at low cost. The most important point, however, is that the contraction or decrease in volume (6 to 8 per cent), which is inexperable from the process of crystallization, has no influence whatever upon the act with the electrodes, as the close of selenium is

SELECTOR CELL WITH CONTACT BY PRESSURE.

given lis definite form after the contraction has tak place Strong currents of short duration do not lead to the destruction of the cell, as there is full scope for expansion

Despite these important facts, this method has not Despito these important facts, this method has not been litherto twed bes ause very this plates of solen inm are necessary as the action of light is limited to an extremely thin layer of the exposed surface (rai-culated by Marc to be about 1/500,000 Inch thick) Noreover, selenium is rather fragile and being of high resistance beavy pressure must be used in order to realize good co

The author discovered that selenium, when molten The author discovered that selenium, when motion between a cold and a very bet glass plate, strongly adheres to the latter, after the crystallisation. It is thus peasible to cover a thin (1/260 inch) finishing glass plate with an exceedingly thin conting of selenium (1/1/000 to 1/20/000 linch) which has a highly polished surface that gives very good contact with the electrodes. These consist of gill stripes on a glass plate (Fig. 1). There are from 250 to 2,500 electrodes. on every inch

Cells constructed after this method are very reliable and show remarkable constancy. They are of small specific working surface. The following is a description of a cell actually made

Working anriace = 14 by 14 inch Roulstance in the dark = 20,000 chms.

Resistance in ordinary daylight == 10,000 chms. Resistance in strong fight == 3,000 chms. Maximum intensity of current == 0 0018 ampers Fig 2 gives a diagram of the cell.

Fig. 2 gives a diagram of the cell. Fig. 3 is an end view of same Glass plates with a thin coating of metal (silver) have before now been used as electrodes for substances sensitive to light This combination or at least the uits sitained are n

Billing it with tobacce smoke Paradozes of Subillion.—Everybody knows that water boils at the temperature of 215 dag Fahr But if an uncorrived bottle partly filled with water is set in a saucepan containing water in which a good deal of any that the saucepan containing water in which a good deal of any that the saucepan containing water in the bottle will been to boil while the water coulds at the pressure prospirit lamp or etherwise, the water in the bottle will begin to boll while the water outside still remains perbegin to boll while the water outside still remains per-cetly quiet. Yet the water outside must be at least as hot as the water inside (313 dag Fahr), for the latter is heated by the former Hence was see that water which centains sait in solution does not boil at 312 dag. Fahr The same effect is produced by dissorting any other solidembatance in the water

other solidambetance in the water Now, if the bottle is taken from the hot brins and corked, the water in the bottle stops boiling, but it will boil again, even after it has cooled many degrees, if cold water is poured on the upper part of the bottle. The explanation is that the boiling point or water is affected by pressure. It is about 312 dag. Pair under the ordinary pressure of the atmosphere (exactly 313 the orumary pressure of the atmosphere (exacuty 212 deg when the barometer stands at 20 juckes) hat if the pressure is reduced, water boils at a lower tem perature. When the water bottle was corked and taken from the fire, its upper part was filled with steam at atmospheric pressure, which had expelled the steam at atmospheric pressure, which had appelled the air originally present. As the bottle cooled, this steam partly condensed and its pressure was diminished, has not sufficiently to permit the water to boil, because the water cooled aiso and its gradually diminishing temperature was always a little below the building point corresponding to the actual pressure. But the application of the coil water caused a rapid conden-sation of steam and a sudden lowering of the pressure. without having much cooling effect on the water, which equently began to boti.

consequently began to boil. Distillation "The same apparatus may be employed to illustrate the process of distillation." The brine in the pan is replaced by fresh water, a belie is borred in the cork and a giase tube is fitted to the hole. The water in the bottle is added one-lenth its volume of atroolo, or less. The bottle and pas are placed over the lamp, as before, and bested gently "Before the water in the pas has resched the boiling solat the vagor of the more volatile slooked (mixing with a lib-

the water vapor) issues from the end of the glass tube, where its presence can be detected by its oder or by the application of a lighted match, which will result in the production of a call blue fanne. The fet should not be lighted until the mixture has been heated long enough to angel the air from the bottle, as the ignition of a mixture of air and alcohol would produce a Victoriest explosion. For this reason the corft, though it sent explosion. For this reason the cork, though it should be air-tight, should not be inserted too tightly With this precaution an explosion will drive out the cork, instead of shattering the bottle. This experi-ment, and the others performed with this apparatus, should not be attempted by children or careless per-

sons.

OTHER WORLDS IN SPACE

(Continued from page 169)
graph is being taken. A careful obse
with such an accurate instrument wath such an accurate instrument will obtain the spectrum of the star in the middle of the photograph fanked on alther side by the spectrum of the metal iron or titanium or the gas hydrogen. placed there by the use of the electric convent and induction coll Astronomers use different metals for the purpose of comparison, the Yerkes Observatory, for instance, employs both iron and titanium on the same plate
A good photographic spectrum will the

consist of that of the star to be investi-gated, supplemented by the lines of the comparison spectrum How are these spectrograms to be interpreted? And how can they tell us anything about stellar motions? Remembering that light is a wave motion, we have a simple analogy in the case of sound, and one with which everyone is familiar. In traveling in an express train which passes another going in the opposite direction, we have all of us noticed that the pitch or tone of the whistle or bell of the other engine suddenly drops as it passes by us. The res-son is that sound is also a wave motion (though the waves are much different from those which cause light) and the quickly approaching engine causes more waves to crowd into our ears each second of time than it does when the engines are not moving. As the tone is determined by the number of waves which fall on the ear drum every second, the consequence is that the pitch of the whistle or bell is raised while the two irains are approach ing, and for the same reason it is lowered when the two after passing are going away from each other. The change in the of the whistle depends on the spec of the two trains and also on the velocity

of the two trains and also on the velocity of sound and as these are comparable, a divided change in tone is readily noticed Applying the same ideas to light we have what is known in science as the de ided change in tone is readily noticed with happing the same ideas to light we have what is known in science as the beautiful to the same in the sa the star is oppositing the earth, a shift below and the rear end of the spectrum signal place. The star is opposition that star and earth are separating from each other A measure of the shift and star is star in miles per

some faint stranks of light about two inches long and possibly one sixteenth of an inch in width. His tells the whole story of the stars mother \aturally one for exemination and there it as croscope for examination and there is an pears magnified and is measured. The physical constitution of the Star the metals that compose it is known from the three of the stellar spectrum hydrogen. three of the stellar spectrum hydrogen, for lustance showing its hadge by a series of prominent lines. The motion of the star is shown by the placing of these lines, whether they are skilled from llines, whether they are skilled from their normal position as kiven by the comparison spectrum to the violet or toward the rol end of the spectrum. If there is hydrogen in the star lies the lliues of the hydrogen comparison spec-trum give the position of rest or sero volotity with respect to the earth, and the amount of the shift measured other the microscope gives the motion of the star. If there are other lines in the specfrum of the star las is usually the case) we can readily in an analogous fashion measure the motion. The photographs in the illustration were taken at the Yerkes the littlatration were taken at the Yerkes Observatory with the great 40-inch tele-scope. Two separate spectra are there shown taken but three days apart on Junuary 5th and 5th 1966. The star speclring appears in each between the com-parison spectrum of litudium and it is widened to make the lines more promi-nent and the whole greatly enlarged. The violet and is toward the left, red end to the right Purtions of the comparison spectra on both are cut away in bring the two closer. The munibers on the top give the wavelengths. Notice that all the lines in the lower spectrum are shift. to the comparison lines than in the unper spectrum This is specially noticeable at line 4501 and better still at 4481 A measure of the amount of these shifts gives the radial velocity of the size respect to line earth. The variable ve-locity in the line of sight of this star shows it is not a single star but a system Measures made by the writer on the star β Trianguil show the following results whore the radial velocities are given in miles per second relative to the sun. The plus sign means that the star is increasing its distance from the sun and a minus sign that it is moving toward the

1909--Bepl 7 Sept 8 + 31 miles per second + 31 miles per second Bout. 18 -- 5 miles per se cond + 1 mile per second Oct 12

+ 18 miles per second The measures must be carried out with The measures must be carried out with nitroes care. If the spectrum of the state is good with many well defined lines, the radial winting it of the carrier was made with the carrier was made with the carrier of one-to nit in a mill per second Thinks of this wice light trive is at the rate of the carrier of metal was a second when with number of millions of allillons of was well as the carrier of 186,000 miles per second when six humber of millions of allillons of was well as the carrier of the ca enter the spectroscope every seeind and when in addition the star is so far dis taid that its light even when traveling hundreds or thousands of years to reach nundreds or innusands of years to reach us. To contemplate it makes our minds whire at the controlly of space and causes us to low down in recrence to the conderful launen intellect that can solve such molderns'

investigations of certain stars show us that at one time it may be moving toward our sun once in a few days or weeks the direction of motion may be reversed and it is traveling away from the sun. The so that variable velocities in the line of sight as in \$\beta\$ Trianguil denote that two or more suns are present to tion, and another body must be present or more sums are present in a system and they are in revolution about each other At our distance from the stars the (Concluded on page 172)

arataly, and hence we have a compara-tively new class of stars, these which ap-pear as single even in the most powerful telescopes, but whose motions in the spec-troscope show that they are really double suns. These are called spectroscopic binaries. Recent researches at the Observatory, Terkes Observatory binaries. Recent researches at the Lick Observatory, Terkse Observatory and other places bring to our knowledge most starting results. Imagine two sune each many times more massive than our own, rapidly revolving about each other in a few hours! In addition to this comes the fact that at least one in every few store so for investigated turns out to be stars so far investigated turns out to be not a single star but a system, and it has become necessary to reconstruct our ideas regarding the importance in the universe of this small ball which we call Mother Earth.

Bring Pearls.

PATTURE Transferred polithers for Pales.

PATTURE Transferred Polithers the characteristic forms and dense register with the control of the characteristic forms of the characteristic for

the controlling forces of society, by age and industrial misfortune, as well as by and industrial misfortune, as well as by infancy, congenital incapacity, and weak-

ness
The middle-aged and the socially in cient now form a relatively larger section of society than ever before. There are two reasons for this. The first is, that while there may not be as many children born now as formerly, among certain peoborn now as formerly, among certain peo-ple, of the number born a much larger portion reach maturity. In other words, the ratio of adults to a given number of births has increased. The second reason is that modern business methods and the is that modern business methods and the modern corporation, especially the manu-facturing corporation, have created new conditions and complications. They have added to those who join the dependent classes under a simpler life, those who become dependent because their active lives have been devoted to highly spe-cialized work. Highly specialized labor is constantly

Highly specialised intor in constant, and this menace increases as the age of the worker advances. Under the fierce competition (Continued on page 172.)

An average American knows many people. But he does not always know where they are.

He has a thousand friends and acquaintances. Where are they at this particular moment? He can be sure of some of them-perhaps a dozen. But he wants to locate one or more of the others.

The Bell system enables him to reach them.

If he finds his friend at home, or in his place of business, he talks with him at once. If he learns that his friend is in some other town the Bell System will furnish the connection.

Cities are larger than they used to be. Men know and need to know more people. Yet the need of keeping in touch is as great as ever. Without Bell service there would be hopeless confusion

The range of the telephone is not confined to one town or one community It is not satisfying simply to learn that a man is out of town; through the Long Distance Service of the Bell System he may be reached wherever

The Bell Service extends to all communities It reaches the millsommunities it reaches the mili-ions of American people. One in twenty is a Bell subscriber. The other mineteen can be found, because Bell service is universal

The telephone does more work for less money than any other servant of mankind. There is economy as well as efficiency in one system, one policy, universal service. Every Bell Telephone is the Center of the System.

(Continued from page 171) which governs the greater portion of our industrial life, new processes, new meth-ods, short cuts, labor-saving devices, new entions, are all engerly sought by the inventions, are all eagerly sought by the employer of labor. Some of these are revolutionary in their effects. They call for a radjustment of the whole plant When that readjustment comes, the older men are invariably dropped. In short, the avenues which lead to employment, for all highly specialized labor, are pracfor all nightly specialized labor, are prac-tically open now only to youth. The middle-aged man enters with difficulty and the man past middle life substan-tially cannot enter at all. The man who did many things, none of them highly similared from twenty to sixty five likely never to become entirely dependent upon society. The man who did some highly specialized piece of work which involved only a part of some specific ihing, or even a part of a part, may be forced into the dependent class before he reaches old age, and when he joins that class he is much more helpless than the came no is niute more neighbors than the man who has done many things. It is probable that the specialist, ultingle he labored fewer years, rendered society the more valuable service of the two, and that therefore he has, morally at least, a that therefore he has, morally at least, a clearer title to consideration. But how-ever that may be, he is the inevitable product of the whole plan of society and business, and the obligation of the man who employs him and the interest of general society in what finally becomes of him, are clear and unavoidable. That itself against the menace which it con stantly faces or that it must be help outright after disaster or age come a ompelling facts in the sociology of the

There can be no question that a system which teaches these people how to pro-tect themselves against this menace, i more in harmony with the genius of our institutions than a system which coerces thom into action or a system which final ly places the burden of their support and rare upon general society. It does not follow that a system which works well in Germany would work well here, or that a system which appeals to the needs of the people of Great Britain will answer here. There are distinct advantages in the German plan,—chiefly that it is com-pulsory and that the laborer is forced to make provision for certain benefits even though he may have no very intelligent though he may have no very interingent understanding of the wisdom of the plan or its effects on society. There is n dif-ference between the compulsion of gov wrmment, which tells the workingman that rertain things must be done, and the proposition of a corporation which tells a man what the conditions of his hiring

If the conditions named by the om player involve some system of life insur-ance some system of deferred annuities, a man can simiy the question and luke a position or leave it since because it rec onmends like if to his budgment or piler wise This is a slower process than the German method and probably for a good German method and probably for a good many years will be more expensive, but it seems to me to be in harmony with our notions of individual responsibility and the rights as well as the obligations of Ametican citiz nahip

The efficient omployee, in specialized labor, has a fair claim to something be youd the returns contained in the ord eary contract of hiring This right may be strengthened and its realization vanced, but it cumou directly be met, in this country, by governmental action The capable worker deserves and should demand a programme of hiring under which he shall be entitled—and entitled by contract not by the grace of his om ployer—to certain protection for his fum ily if he dies prematurely, and to certain protection for himself if in the vicinsitudes of industrial war he is shelved and pendent class

There are sound reasons why corp (Concluded on page 174)

tons should avail themselves in rork of the highly developed system insurance and amustics presented by the responsible insurance institutions of this and of other States. Any effective sys-tem if established by corporations indetem if established by corporations inde-pendently, will be based on the principles and methods used by the insurance com-panies, and therefore the work for ob-vious reasons is in the end likely to be more effectively and more economically more effectively and more economicaty done by men who are experts and spe-cialists than by men who undertake it with no special training and with minds chiefly occupied by the demands of other lines of work

(Concluded from same 173)

I shall therefore assume that life ini shall therefore assume that life in-surrance, and probably other types of in-surance including accident and sickness insurance, as represented by existing cor-porations is not only well equipped to help in the solution of this problem, but is a part of the evolution of the times which has produced the problem itself, and is another illustration of the curious fact that in the processes of evoluti olution of a problem often appears at solution of a problem often appears at the same time the problem itself is evolved For example, what might have abspected in the unermost industrial activity of the l'alled States and its unceasary output of securities seeking purchasers if millions of people combin-ing their mails awings in the reserves of the great tife insurance companies had not appeared upon the scene contempo not appeared upon the some contemporareously seeking securities in which to invest their money? The function of its lasurance and of other types of insurance on the one hand and the obligation of the employer of labor to his omployees on the other, bear, it seem to me, an identical relation

identical relation
Life insurance is air-eady effectively at
work While the employer of ishor has
only in the most limited way used the
idea or appreciated its beneficente, proreas has been made toward the solution
of this problem Mitimizating industrial
companies whose business is supposed to be
companies whose business is supposed to
confined to pergite of means, we find the
senses of the country over is a little
and the country over is a little
of accelled repulsar insurance is held by
poonlo of small means. If now we add
to these the multions who carry what is those the millions who carry what is lied 'industrial' insurance, and the called 'industrial' insurance, and the other millinns who have so-called "fra ternal' insurance we have covered sub-stantially the whole insurance field We stantially the whole heavrance field We comprehed an interset whose accumu hittons surpass those of any other single committee and endeavor respect the accumulations are necessary of the control to the sense of obligation of the employer We have now reached the point when the em ployer is beginning to do his part—but as yet he has nniy made a boginning That he will do more is certain, that he will do much is aimost equally certain That much is almost equally certain. That existing insurance institutions will be utilized is, I believe, a necessity

bys Formed by the Co Metal Powder

The ordinary method of preparing alloys consists in melting two or more metals together, and allowing the melt to metan topecans, and anowing the men to crystallize after cooling. Can not the same alloys be obtained by compressing the component metals at ordinary tem-peratures in the shape of fine powders? Dr W Spring showed as far back as 1882 that under a pressure of 5,000 atmospheres the powders of the constituents of the Rose and Wood alloys will form of the Rose and Wood alloys will form conglomerates, the melting points of which nearly coincide with those of the alloys obtained by melting in 1888 Hal-look showed that by mersiy uniting at or dinary pressures the powders of the same constituents there is obtained a mixture (Concluded on page 176.)

melting at a lower temperature than the melting point of the most fusible component By compressing sine and coppe powders, Spring obtained a conglomerat which was distinguished from brass only

which was distinguished from brass only by its slightly darker color In spite of these partial results the problem had not so far been definitely solved It remained in fact to be seen whether, by sugmenting the speed of fusion of the mixed metal powders, pressure reguly favors the formation of those ure really favors the formation of those compounds which are characteristic of siloys obtained by meiting. This quee-tion is answered by Prof. G. Tammann on the basis of recent experiments by G.

Masing

When submitting a mixture of filings

when submitting a mixture of filings of two metals forming neither a chemical compound nor mixed crystais (c g , xinc and cadmium or copper and silver) to a pressure of 4 000 atmospheres, and heat ing the conglomerate thus obtained the rising curve of temperatures is seen at a given point to slacken down after reath-ing a temperature 1014 deg C higher than that at which the whole is found to As far as its thermal properties meit. As far as its thermal properties and its structure are considered this conglomerate is practically identical with siloys obtained by meiting

Again by compressing under high pressure the powders of two metals form pressure the powers of two means forming a definite compound and capable of mixing in sil proportions in a liquid cou dition and by heating the conglomerate thus obtained, two stopping points arr found in the curve of temperature. The first of these points corresponds with the melting of a compound formed at the sur face while the other corresponds with the for instance, with mixtures of magnesium with zinc lead tin or bismuth. The con-glomorate composed of magnesium and stomerate composed of magnesium and autiniony has only a single stopping point situated at 300 deg C below the melting point of antimony This corresponds with the formation of the compound

Mg,8b,
The temperature then rises very rapidly in order to eventually fail down to the melting point of the alloy The to the conglomerate of two metals form lot the conglomerate of two metals furn-ing an untherrupted arise of mixed crystals, such as magnesium and ead mium on the one hand and lead and thal ilum on the other When heating such conglomerate only a single stopping uniat is observed corresponding to the melting point of the most cusible com-ponent The form then assumed by the curve depends on the diffusion of the

curve depends on the direction of the two components into one another.

The conglomerates obtained merely by compression do not contain any frate of mixed crystals. Microscopical examina tion thus only shows the existence of tion thus only shows the existence of grains of copper and tin in recently pre-pared conglomerates II, however these mixtures be heated to 200 deg C (i e, below the melting point of the tin) there below the melting point of the tin) there are found between the grains of copper and tin, two layers corresponding to the compounds Cu,8n and Cu8n respectively if these conglomerates be hosted during 20 hours to 400 day a layer of mixed crystals, corresponding to the formula Cu,Sn, la found This proves that com-pounds of these metals are permeable to

their constituents.

The following conclusions are derived

The compression of two metals at ordi nary temperatures will yield conglomer-ates containing only the pure metal i e neither compounds nor mixed crystals as characteristic of alloys obtained by melt ing. Mere compression thus does not activate diffusion sufficiently to bring about combination or the formation of mixed crystals If, however, heated met-als (1 e., with increased speed of diffu-ation) are submitted to pressure there is obtained not only a more coherent mass, but a portion of the metals is found to form compounds and mixed crystals, so as to produce a conglowerste which is very much life a real alloy mixed crystals If, however, heated m

THE COMMISSIONER OF PATERTS' ANNUAL REPORT

HE annual report of the Commissioner of Patents Hon Edward B Moore, for the fiscal year ending June 10th, 1909, has recently been published and contains several useful suggestions for the improvement of the office of value to inventors and patentees

Hefurring in the work of the office, he says

There were received in the last fiscal year 62 800 applications for mechanical patents 1 186 applications for designs, 192 applications for retasues 2 052 caveats 7,509 applications for trade-marks, t,00t applications for jabels and 38 applications for prints. There were for most and its applications for prices lines were for 152 fig patents granted including resums and designs and 647 trude marks, 770 labels, and 211 prints were registered. The number of patents that express which were by operation of tew forfeited for nonpayment of the final fore, was 6,763.

the final fore, was 6,763
"The applications for patents for inventions have increased over last year by between 4,000 and 5,000 and 5,00

ich became effective July 1st, 1909, repealed th act approved June 18th, 1874, under section 3 of which labels and prints have been registered in the Patent Office Consequently no certificates of registration of labels or prints have been issued since July 1st, 1909, except those evidencing registrations effected on or be-fore June 30th, 1909

"The money receipts from all sources were \$1,975,-919 97, and the expenditures \$1,887,443.35, leaving a net surplus of receipts over expenditures of \$88,476 62 The grand total of receipts over expenditures for main ling the bureau from 1836 to date is now \$7,0 This vast sum represents the earnings of the Patent Office, and the bureau is therefore more than setf-anpporting '

Owing to his success in securing additional appro-priations from Congress in 1908, the salaries of the priations from Congress in 1908, the salaries of the examining corps were increased on July ist of that year, resulting in a noted decrease in the annual resignations. Owing to the additional force he was authorized to equiply and the releasing of the shiftled examiners, the work in nearly all of the examining divisions of the office is practically current. He aims to keep the work current in all branches of the office, if possible, which is certainly a most inudable pagpose, and one that should be carefully considered by Congress He says

The restd increase in the number of application filed and the constantly increasing field of search om-bracing as it does not only United States and foreign patents, but also publications of every character, make it imperative that edditional force be provided each

year to prevent accumulation of the work."

He has asked for one new principal examiner and twenty additional examiners to further the work of tassification of patents. There are now 930,000 United States patents, approximately half of which have been rectanded Over 2,000,000 foreign patents and nearly 90,000 volumes of the scientific library remain

The models formerly stored in the basement and on the first floor of the Patent Office building have been moved to another fireproof warehouse a short

Additional space for the storage of new volumes of foreign patents by at least 150 linear feet per an num should be provided for in the office library. An

appropriation of \$2,000 for this purpose, which it is thought will be sufficient for a period of five years, is habrame

The space aveilable for the storage of printed ek The space available for the storage of printed classic decipies of patents is becoming crowded and the ercommodations in the attoracy's and public search room are becoming insufficient for the work done there. One of the long hallways that has been see apart for this purpose is in a competed condition and is inadequate for the purpose flows changes to fifted the purpose of the competed of the purpose of t ent on three sides to conform to that of the Ninth Street front

Ninth street from ile believes that the time has arrived when meas-ures should be taken to secure the construction of a new larger huliding in which ample room will be sflorded to properly and promptly tran-ness of the office. He says particularly

ness of the office He says particularly
"It is necessary that patents for new inventions
should be issued with the utmost promptness efter the
application for patent has been filed for such inventions form the basis of vast industries, which inure not merely to the profit of the inventor, but to the benefit of the manufacturer the inborer, the trader, the professional man, and the consumer, and to the comme and Germeny have each recognized the necessity of providing ample facilities for the work of their patent providing ample racinities for the work of new buildings for their patent offices, which are in every way more commodious and better adapted for the business of a patent office than the building which now houses the United States Patent Office, although the patent bust ness of cash of those countries is small pared with that transacted in the United States Patent

He urges that the new building be located near He urgest that the new nutting be overseen mean-the Congressional Library on a square north of that building as embodied in Senate bill No 3,564, intro-duced by Senator Daniel, Jenuary 24th 1898. The surplus to the credit of the Patent Office in the Treasury Department of \$7,060,547 he thinks would go far

ary Department of \$7,000,047 he thinks wound go lar toward paying the expense of the building. As to future desired legislation he continues his recommendation in previous reports by advocating an amendment to the statute which has for its object the shortening the course of appeals from the primary examiner (in : park cesse) to the board of examiners in chief and the Commissioner by combining the board is chief and the Commissioner by combining the board of examinary, to their with the Commissioner of Patents and his first and second assistants into a single ribunal, any three of whom shall constitute a quorum, to which all appeals shall lie, whether from a primary caminer or trom the examiner in interference and from which appeals would lie to the Court of Appeals of the District of Columbia The elimination of one appeal, he states, well materially shorters the lines and effect a considerable swing of expense to applicants we believe there is much merit in this recommendation and trust it may receive have only accommendation and trust it may receive have revise considerable consider mendation and trust it may receive favorable consid-

A further additional provision recommended is the amending of section 4 889 of the patent law by re-quiring to be filed with the drawing two photographic One of the photo raples thereof with the application. One of the photographic copies is to be kept in the file wrapper and the graphic copies is to be kept in the file wrapper and the other is to be filed in secret archives in charge of the chief draughtsman while the drawing itself will be kept constantly in the office of the examiner and will be available at all times for imspection in their re-spective divisions. He states there have been caused of trand in withdrawing and substituting other draw

of train in windowing and substituting outer university for the originals and that some such plan is needed to detect possible unauthorised changes. We think if would be more practical for the Commissioner to have the negatives made of the drawing at the time the application is filed, and withhold the delivery of the filing receipt until the official photo-grapher had certified the photograph as being an

exact reproduction of the drawing

The Commissioner advocates the formati "patent ber." and suggests before an individual be permitted to practise before the Patent Office he will be required to pass an examination as to his moral legal, and technical qualifications before a committe regs., was excessed quantifications secrets a committee appointed by the Commissioner of Patents, composed of officials of the office and patent stormays of well-known standing in the profession, who shall conduct the examination under the direction of the Commis-sioner. The report of the committee is to be subject to his approval. This suggestion appears to us to be very approval. very appropriate

in regard to the amendment and improvement of treaties with other countries concerning industrial property, it is proper to say Commissioner More has been most ancesated in securing advantages for Amer-ican inventors. He says on this subject

ican investors. He says on this subject "I am gratified to report that during the last year a treaty was negotiated with Germany, which confers great benefits upon the American inventor The patent laws of nearly all the foreign countries contain a

cleans providing that it as invention is not that it, manufactured or practiced—to such country within a certain period, ranging from two to four years, the patent may be annulled. This treaty with formany months of the provided that the provided any provides that the working of a patent in one Germany provides that the working of a patent in one of the contracting countries will have the same force and effect, so far as avoiding the revocation of the patent is concerned, as if it had been worked in the country in which the patent was granted This treaty country in which the patent was granted This treaty, has practically assured to American inventors the pro-tection of their rights in Germany during the full period for which the German patent is issued, con tingent only on the working of the invention in one of the two countries

Prostate of the

"It is understood that Sweden has modified its laws to extend similar protection to other countries which do not require the working of the invention within a specified period, and negotiations are now pending with nearly all the European states for the promulgation of treaties of the same character. In order to sasist in the negotiations of these treaties, I have been delegated by the Department of State and with your delegated by the Department of State, and with your permission I shall visit the capitals of several foreign nations to assist, so far as within my power, in the regotiations of such treaties, which if concinded will regotiations of such treaties, which if continued will greatly extend the protection of inventors, manufactur-ers, and the industrial interests of this country, as well as those of the nations with whom such arrangements may be made."

ates the next International Convention for the Protection of Industrial Property is to be held at Washington, D C, in May, 1911 About this he is most sanguine and esthusiastic. He save

meeting of this convention is most important to the interests of the American inventors and manu to the interests of the American juvantors and manu-facturers. The 21 nations which are athermats to this union will be represented by delegates having full power to negotiets agreements in respect to the re-ctiprocal protection of patents, designs, trade-marks, and industrial models, which when ratified by their respective governments will have the force of treaties. The efforts of these conventions in the past have it reriprocal protection of patents and trade-marks having been ratified by all adherents, which comprise the leading commercial nations of the world and the Congress of the United States has in each instance as ed the patent laws of this country to accord with the terms of the international agreements concluded at

Not only are the members of the union reby delegates but all other civilized nations, not mem-bers of the union, are invited to send representatives in the interest of furthering the reciprocal protection in the interest or urracering the reciprocal protection of industrial property. It is expected that at this com-ing convention a strong effort will be made to har-monise the laws relating to patents and trade-marks throughout all countries in such a manner that adethroughout all countries in such a manner that ade quate protection will be given to an inventor, no man quate inretection will be given to an inventor, no mat-ter of what country he may be a citisae, without the necessity of obtaining expensive patents in such of the several countries in which his invention may be used or sold it is also proposed to perfect and extand the international registration of trade-marks and thus cruther the reploymed protection of commercial indus-

THE ALL-STREE CAR THE CAR OF THE PUTURE

OR many years past the Scientrific American has etrongly advocated, on grounds of public health and safety, the building of all-steel health and sastey, the building of altieute cars for railroad service, and we are there-fore much gratified to learn that the Pennsylvania Railroad Company is adding to the stele-are equipment at a rate which promises, before many years, to clini-uate the present wooden ext, and provide that great system with an all-steel passenger car equipment it was as on August 12th, 1964, that that railroad an-neanced that all future passenger sulprouch quoid be halt of size and that the design would be such as to balli or steel and that the design would be such as to render it indestructible either by collision or fire. In planning the cars and establishing those standard types which are now being copied in all the new equip-ment, no expense has been spared to build a concl-which should provide the greatest possible strength, and finish it with an inside lining that should be a soluted to more than the standard of the which should province can greatest possions account.

and finish it will am inside birting that should be absolutely subtranshe safe possess the added and not inconsiderable safe structured that it would be a poor den-dence of best and notion. The first order, placed in ductor of best and notion. The first order, placed in the canada. 10 dining care, 21 combination passenger and baggane care, 29 Baggane care, 28 postal care, and 1 company car, making a total of 134 steel care, Fer-thermore, the Pullman Company has been building for the railroad during the part four years getter all-steel parter and sheeping care. About 500 of these will shortly be placed in service With the present steal equipment and some 250 care to be ordered during the present year, the Pennagivania railroad will in a short with law ten service 800 of the own steal passenger care and about 500 ottos Pullman care.

Scientific American engineering.

In a paper recently read by Mr Henry Heas before to American Society of Mechanical Engineers on the swer lost in belting, it was shown that 90 per cent the An power jost in centurg, it was snown that so per cent of the power transmission lost was due to journal friction. This may be materially reduced by substi-tution of ball for plain bearings, provided care be taken to sait the size of the balls to the load.

mittee of the American Railway Mainten ance-of-way Association in a recent bulletin takes up the subject of rail specifications For Bessemer rails of \$5 to 100 ibs. it recommends the following composiof 80 to 100 IM. It recommends the following composi-tion Carbon, 46 to 0.55, managanese, 68 to 115, phosphorus not to exceed 0.10, and sulphur not to exceed 0.075. The recommendations for open-hearth state for the same waight of rail, carbon, 0.88 to 0.75, managanese. 0.78 to 1.00, phosphorus not to exceed 0.04, and sulphur not to exceed 0.06

The two latest German dreadnoughts are to be equipped with turbinos, and special interest attaches equipped with turbinos, and special interest attaches to the fact that two rival types of unriline, the Parsons and the Curtis, will be tried out against each other The "itelmdal" will be propelled by triple screws op-erated by Curtis turbinos, and the slater ship will be equipped with Parsons tunbines of equal contract

A method of simultaneously excavating and lin-ing vertical shafts is contemplated in one of the con tracts for the Catskill water supply In the In the shaft concrete forms will be erected and concrete iaid. The excavating will be carried on below, the material be-ing hoisted through a hole in the center of the plat

Wa recently noted in these columns the rapid is rease in the weight of iccomotives. A similar growth is taking place in the cars, the Pennsylvania Rati-road Co having recently asked for tenders for 10,000 coal cars of 70 tons capacity and an overload capacity of 10 per cent. As the sued in the cars will weigh 20 tons exclusive of the wheels, the maximum weight of car and load may reach 100 toas

Apropse of marine turbines we note that Mesars Parsons & Co., recognizing the advantages of twin-serew propulsion, as proved in the Curits equipment of the arout "Salem," have developed a modified Cur-tic partial admission turbine which they are to install in one of the new \$ 200-ton 26-knot British secouts. A sister ship will have Curtis turbines. The Parso turbines will weigh 340 tons, and guarantee for power on 13 pounds of dry steam per horse-power per hour The Curtis turbine will weigh 250 tons and guar-antee 125 pounds of superheated steam

There are persistent reports that the Hamburg American Line is about to build two bugs steamers which will rival the While Star libers (Tympic and Titanic, which are to be in service during 1911 The reported dimensions are Longth, 850 feet, been, feet, and depth 65 feet Reciprocating engines of will drive the ships at a sp

A recent bulletin of the United States Geo Survey gives some statistics of producer-gas power plants in the United States which are vary favorable There are over 500 plants in operation, aggregating 115,000 horse-power The government testing plants 115,000 horse-power The government testing plants at St. Lonis and Norfolk show a fuel consumption of as low, under favorable conditions, as 0 95 pound per electrical horse-power Comparative tests of 75 grades of bituminous coal under steam bollers and in producers show a ratio of 2.7 in favor of the latter

One of the most important branches of the general scheme for the development of Japan is the extension of her railroad development along predeterm of her railroad development along predetermined lines which have been laid out with an eye to the descriptment of the country considered as a unit A notable swant in this development was the recent complete of the railway between Hitovoshi and Kageshima, which connected up the last like in the trunk in running throughout the full length of the empiry. Tho total length of the into in 1700 miles, and the distance from north to south of the island can now be faced year. 1917-1908. 4431 miles and the railway more opened to traffic and 445 miles of railway contrailed by utwiss interests. trolled by private interests

trolled by private interests

A premating installation of a windmill-electric plant has recently been completed at Worcester, England, by J. G. Cullade & Co., of London: It consists of a 24-foot wind turbine carried upon a 74-foot tower, the bactery and witchboard in one of the outbuildings of the house. Overhead copper, online carry the current to the bactery some 645 years dictant. The possession are 460 to 80 revolutions per minute are wind; thus a 46 do to 80 revolutions per minute are wind; thus a 46 do to 80 revolutions per minute the wind turbine. It has a maximum output of 4 killeratiz with a neural present of 70 volta. The plant runs about 100 lights in the house, and serves also for five a other gutter, a civilage size, and a received to the content of the wind turbine. also to drive a chaff outter, a circular saw, and a re

PLECTRICAL.

A company has been formed in London to introduce and encourage the use of electricity in the poorer dis-tricts of the city. The company agrees to wire and supply any apartment of three rooms and over with supply any apertunent of three cents a week per lamp from April to September and seven cents a week for the reat of the year. The lamps however must be reed by the cons

A new mounting for metallic filament in lamps has A new mounting for metallic filament in lamps has been devised in Germany. The mounting provides for the shrinkage of the Stament which is not aways solitors, and for this reason ones in Sinners it is supported at its lower end on a small spring which is covered with a paste of flusty providend tungetes so as to prevent it from being consumed by the heat of the literadescent filaments.

of the incendescent filaments
The use of the telephone for train dispatching is
alowly apreading The Gulf, Tozas & Western Raliroad is emipping its line with a telophone system for
train dispatching between Jacksbore and Benjamin
trass. The road connects the Chicago, Rock Island &
Gulf and the Wichita Valley ruitroads
Whon the telephone system on the Bepicane division of the Great
Northern Raliksy is completed there will be 2100

A by electric plant in the Hakone Mor A hydro-slectric plant in the Hakono Mountains about 36 miles from Yokohama, lapan has recently been completed and is particularly interesting for the fact that much of the apparatus used is of Japanese make The Shibaura Electric Manufacturios Company of Tokio has built the 600-kilowatt air-co ersed transformors to be used at the sub-station in Yokoliania. A large number of the high tension lusulators used on the line are of the Shibaura type About one-third of the line is supported on to which is a new departure for Japan At the power which is a new departure for Japan At the power istation the water is carried over a distance of 15000 feet in two parallel plops libre that lead to the turbo-generator units. In upper laid of the plops libre con-sists of reverted plops made by the Shibanan Company Tho piant comprises two 2000-killowatt allernators and the current which is graverated at 3450 volts, is stepped up to 46,000 volts for the libre

In a recent number of the Electrical World appe an interesting article on the wireless telephone the author arrives at the following conclusions is, then quite evident that future systems of wire-less telephony must either eliminate the ose of microphone transmitters or find types for in advance microphonic transmitters or may types far in auvance of those used to-day in addition to this, some more powerful and more reliable oscillator must be substituted for the art. If no great difficulties arise in its operation and its cost be sufficiently reduced this sta operation and its cost or sums inity reduced this substitute may be the high frequency alternator. With the few weak points of the present system removed and the useful parts of the apparatus retained, the wireless telephone will come into all the uses to which it is adapted but the climination of the defects will involve a departure from present methods.
Until these are discarded, attempts at commercial vireless telephony will be futule

The following useful olevitrical shop kink was not-lished in a recent number of the Siectric Rallway Journal describing a method of soldering broken or burned-out wires without removing them from the armsture "The damaged wire is raised a little way not of the slot. The insultation in them seraped off for a few inches and the ends of the broken wire art end of smoothly after which a piece of wire is cut to fill the gap. One end of the inserted wire is then butteneded with the armsture wire and the ends heated by a gas torch must live are used to "Fron this a little color is inserted between the anna. When is color is inserted between the anna. When is consider is finered between the anna. The following useful electrical shop kink was splices are completed in this rassion the pare wire as wound with slik, as the latter takes up less space than tape. After the slik has been covered with insulation the coil is ready to be returned to the slot. During the operation of heating with the torch the adjacent wires are protected by fiber barriors"

Et is reported that at the time of the rescue of the crew of the steamship "Kontucky" by the "Alamo," which had been summoned by wireless telegraphy, the wireless apparatus had almost been put out of mission by the water that partially submerge mission by the water that partially submerged ridynams. By wraping the dynamo with tarpusing its was possible to keep the machine running until help animoned by wire-see ridegraphy, and on a previous occasion the apparatus was put out of commission by the encreachments of the water It has been suggested that storage betteries should be used to supply the current, because they could be placed where there would be no danger of injury by water where there would be no anner of injury by water But as storage batteries would be impractical owing to the motion of a vessel in a atorm, some arrange-ment should be provided for placing the dynamo and oline engine for driving it well above the danger

SCIENCE

Recent experiments have proved conclusived it will pass a 200-mest sieve, will exuteds from con tact with either a naked fisme or with the arc electric current

The hullding of an observatory on the rim of the great crater of kilauwa has been advocated for several years. The prospects are now brighter than they ever were, and it seems likely that the observa tory will be built as part of the College of Hawati

A recipe for a non-shrinking alloy to be used in duplicating patterns, is given as follows by The Metal industry Tin, 10 pounds, xinc, 50 pounds This gives a tough hard metal that runs well if a good krads of xinc is used The addition of 2 pounds of bismuth will render it even more fuld and enable it to be poured at a lower temperature. By using beavy syrues and pouring cold the shrinkage which is slight, may be inreely overcome.

Prot. E B Barnard recently obtained a photos of lialley's come; showing a tail our degree long comet is beginning to wake up Mr Ellerman witi sail for Honolulu on March 8th to observe the transit of for monounce of maint in the conserve file trainet or the little per council across the small disk. He his sent out by the comet complities of the Astronomical and Astrophysical Solety of America. He takes with him a good 4-inch portrait less by Brasherr and a 6 inch countries and monoting leat by the 1 its Observatory He is perhaps the best possible man for the work, and will be thoroughly equipped to obtain the lest results

During the night between October 7th and 8th, 1909 During the night between October 7th and 8th, 1909, a meteoric stoue fell to earth on the farm of Mr W P Nickerson, of Nurwood Mass. The meteorite is a handle mass of very hard gray stony material, much corrugated on the surface, about two and onehalf feet long in his greatest dimension one nearly one and one half feet broad and varying from one foot to one-half foot in the third dimension. Its volume was estimated as about 175 cubic feet lis weight as perhaps 275 pounds, and its density as not

Besides Halley's Contect two other comets may be expected in 1910 The first of these is Tempel's, discov ered July 4d, 1871, at Milan It has a period of 5.75 years It was observed in 1878 1894 1899 and 1994 It last passed perihelion in November It ought therefore, to be expected this spring

The second of the expected comets is that of Arrest discovered in 1851 and the return of which is expe in the summer of this year It was observed in 1857 1870, 1877 1890 and 1907 If was unfortunately piaced in 1903 and therefore could not be observed

The chiaf purpose of the sound proof room at the University of Upsala is the losuring of perfect freedom from sounds from outside By building it us platforms of thick lead and coment and by construct ing its walls of many thicknesses of felt, cork, ashes-tos, and other bad conductors of sound vibrations, the principal object was attained. The room is so quiet that the beating of ones heart or the creaking o one a muscles is at once heard on taking up a posi tion within its closed doors and windows and the only defect of it as a laboratory for acoustic experimenis is that vestilation is absent, and no or remain in it for more than an bour at a time

Prof Lipmana announced before the Academy of Sciences that Madame Curle has obtained a tenth of a gramme of polonium with which she has been ex a gramme of polontum with which she has been sey portnessing Polontum to a radio-active element discovered by Madame Curtle as early as 1888. Intuit of both and the state of foses its power very much more rapidly. It seems rea sonably certain that poloulum is identical with radium F, me of the series of inclais produced by the decom position of radium. The particle of polonium ob-tained by Madame Curle is not entirely isolated, but was combined with accord touths of a militeramus of another hody

A special investigation of the motion of the hridge of the violin has been made by J. W. Gillav and Prof. M. De Haas of Amsterdam. They conclude from their experiments that the bridge of a violin performs a parallel as well as a transverse motion, and that the timbre of the tone is modified greatly whea the in-tensity of one of the motions is altered and the other is left unchanged as nearly as possible have also explained the action of the muto, and the la have also explained the M flow of the mato, and the is a floser which the use of too likely or too thin a hridge has on the sound of a violin. The mute is composed to supposed to "dampent" or "dampent" or "dampent and the matter caused nothing but a general damping by reducing the hridge motion, the mute would only wakes the sound, and the same effect would be obtained by bowling softing an action, without a manuface, but here to trade of softly on a violin without a mute as by bowing hard or a violin with a mute. That, however is by no me

Scientific American

A NEW TYPE OF SELF-DISCHARGING COALING VESSEL

BY E. C. COLEMAN

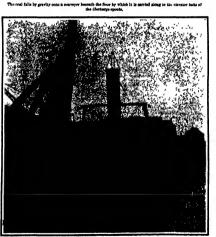

The new system of belt-conveyor discharge has been installed by William Doxford & Sons, Ltd., in a new vessel—the steamship "Paillon"—which they have recently built at the Pallion shippard, Sunderland, England, to the order of the Dunrobin Shipping Compnny, Ltd of Newcastle-on Tyne This vessel has a length between percendiculars of 270 feet, and a ingth between perpendiculars of 270 feet, and a carrying capacity of 3,100 tons on a 17 feet, in the draft. The machinery, comprising triple-expansion capine and multitubular bollers is placed aft. The cabin accommodation is fitted in the bridge and the crew squeece in the tore caste, while the mavigation

accommodation is about midships The inner bottom is raised and shoped upward in the wings and hullt into the sides of the vessel forming a sultable incline for gravitating the enrgo to the con veyers, and also giving the vessel veyers, and also giving the vessel the advantage of being about half loaded when in ballast and bunkers in the center line is constructed a sinps-top fore peak throughout the hold and between this tunni and the tunnel extend her from the entries market to the ing from the engine space to the raised portions of the double but loin are placed the conveyer belts of the Rohins pattern one on either side of the vessel. The eldes of the tunnel below the level of the hatchways over the belts are open for free access to the belts and tarriers at all times. Over these conveyor belts are placed strong iron guide plates extending the full length of the hold and par-tially covering the belts leaving a 24 inch hatch over a 36-inch belt This space is covered in the holds hy cross-laid hatch covers, 9 inches in length and 3 inches in thick ness, which support the cargo and leave the conveyors to work with out carrying the load At the after out carrying the load. At the atter end of the hold a portion of the hatch, over which the 9-inch hatch cover is omitted is covered by a horizontal iron side door operated by a ratchet in the tunnel. On the foreside of the hulkhead is constructed an access chamber in free communication with the tunnel which is of such a form as par-tially to protect the silds door from the cargo when loading, and in the floor of this projection of the chamber is fitted a flap hatch to give access to the hold from the tunnel At the after ond of the cargo space the conveyers rise from the horizontal and pass up ward in iron chambers through the machinery space, and thonce into the conveyer-driving angine room and discharge the load into guide shoots in the stern of the vessel These carry the load on to return belts, which are extended forward both sides on the deck. In a sim-ple form these conveyers would terminate at the fore end of the machinery space, or poop front and the load would be delivered into side shoots which telescope and are adjustable for loading barges on either side of the vessel, the shoots being suspended from derricks or other suitable means. in cases where the discharge is required at a higher level than is attained at the poop front and a large range of elevation is necessary, as for instance, for delivery

on high quays into trucks and into barges alongside, the conveyors are carried forward and hinged at the poop front, and the delivery end is sus-pended by sultable tackie from twin masts or framework, and is raised or lowered according to circum-stances, delivering the load into telescopic aboots sus-pended therefrom When the delivery is into tracks, the "offnide" beit delivers amidships into a cross or the "omittee over centurys aminantps into a cross-own-veyor ampended on the masts, which carries the load to the shore side and delivers by aboots into the tracks. A development of this principle has, however, been

applied to the steamship "Pallion," as, in order to ob-viata the use of delivery shoots, which results in con-siderable damage, the terminal conveyors are carried siderable damage, the terminal conveyors are carried in swirel booms, which are raised or lowwed and swung overboard to the points of delivery, thus per-nitting of the cargo being conveyed direct to the truck or barge without abouts. These booms may also be swung across to the reverse side of the vessel, so that both booms can deliver simultaneously into trucks or warehouse. Another important feature of this dis-

View of the hold

The coal is taken from the bottom of the bold and discharged at an elevation of 40 feet above the water by too and elevating belts operated on the ship. Rate of unloading 100 tone per hour, cost two cents a ton. A NEW TYPE OF SELF-DIRENTARDING COALING VESSEL.

ent lies in the method of delivering

coarging arrangement new in the memory or seavering the cargo onto the belts from the hold, and enabling the operator to have full control and free access at all times to the conveyers and to the fice of the cargo. He may thus superlatend and direct the continuous es at all He may taus supernread and arrest tas continuous flow, and be in a position promptly to correct any tack-ency of the cargo to bridge or to chelps the aperture leading to the belt, which, being the smallest space the load has to past through, insures a centifusous and un-interrupted delivery.

The unloading of a carge of coal is carried on as follows: Presumably the holds are full and the cargo lying solid, carey under the overhang of the chamber on the builthead over the side door, at which point the space is naturally only partially filled. The side door in the covers over the convayers and favors back by the operator in the tunnel, and the loose coal over if immediately travels on to the conveyer, which may or may not have been started. If running, then the flow continues; if standing, no difficulty are the channes the conveyer is culty arizes because the conveyer is

flow continues; if standing, no diffi-culty arises because the convayer is only filled at that point, and the aperture becomes blocked and only clears and flow when the belt is started. Then, if no "pridging" oc-curs, the after part of the beld is rapidly emptied on to the conveyor rapidly emptied on to the coaveyer which is carrying it on deck and into the receiving trucks or barges. If. however, any "hridging" is threatened, the operator in the tun-nel ascends to the chamber, and has free arcess over the aperture to correct any block. If "hridging" is occurs higher in the hold, then he hreaks it hy means of a pinch bar through perforations in the chamber through perforations in the chamber sides. When the after end of the sides. When the after end of the cargo has run to its natural angia of repose, the operator now in the hold merely removes the first cover and places it aft of the aperture and piaces it att of the aperture allowing another portion of cargo to run, he being in a free position to maintain the run and correct any tendency to bridging and to abnormal rushes. If such do occur and incline to block the aperture, he again corrects this and, having run so much more, he removes the next segment of cover, and so on, gradually transferring the aperture from the after end to the fore end of the hold The wing tanks and central tunnel being sieped, the cargo gravitates to the aperture, and the finals are manipulated by and the links are manipulated by the operator, one man being on each side of the hold. An important fea-ture is the inclined shoot, over which all the cargo passes on to the bell. This shoot is carried on travelers on the guide plate sid and is moved by the operator in the hold forward from stop to stop to correspond with the movement of the aperture thus allowing two men to manipulate a whole carge at the rate of 500 tons per honr It is estimated that in regular working the ateamship "Patition" will be un loaded in six hours, or allowing for stoppages in moving barges, etc., seven to sight hours, and this too with but one stoker, one engineer, two inhorers in the hold, and two adjusting the shoots or booms into adjusting the shoots or booms into the craft The total cost of dis-charging the cargo of the "Pallion" will not axceed \$60, incinding tha upkeep of the gear, and it is af-frened that the cost of discharging a similar cargo at, for instance, the port of Hamhurg, is about \$560, that in the work no fewer than 110 men are employed for about elevan hours under favorable condi-

tions.

A steamer such as the "Fallicot" is independent of shore ishor, and so may avoid the frequent delays arising from labor troubles. The humber of more required is see small, and the tion occupied so short, that it would be a single matter to agree the result of the vessel that they receive a fixed the crew of the vessel that they receive a fixed by the crew of the vessel that they receive a fixed by the crew of the vessel that they receive a fixed by the crew of the vessel that they receive a fixed by the crew of the vessel that they receive a fixed by the crew of the crew of the complex products of the crew of the c

NOVEL ELECTRICAL APPLIANCES

BY PERCY COLLINS

The largely increased use of electricity for illuminating distilleries, wine-collars, etc., has rendered obsolete many appliances which were formerly in use-especially those which consume contagns when in opening the continuous contrages when in opening the contrage of especially those which consume coal-gas when in operation. Hence areas a demand for up-to-data inventions designed to meet the conditions imposed by progress. For recent patient illustrates more strikingly the manner in which the ingenuity of mankind beep pace with the exigencies of modern trade than those which are illustrated in the accompanying photographs. The patentoes and manufacture of these original electrical appliances is lir Frederic Bugbes, and of Lendon, Kanghad, and it is to this gestleman that of London, Engiand, and it is to this gentleman that the present writer is indebted for permission to de-sorthe and illustrate the apparatus in question. In the case of the electric search-light or cellar-torch, Mr Hughes claims that the appliance atanda sione, being the only perfect, clean, odorless and reliable invention for thoroughly examining brewers' casks.

vals, refrigerators, spirit or oil jars, etc.

The main details of the cellar-torch may be sp-The main details of the cellar-forch may be ap-preciated by reference to the accompanying photo-graphs. The reader will see that it consists essen-tially of a powerful electric glow lamp of peculiar de-sign, supported at the end of a suitably curved rod The circumference of this lamp is so small that the appliance can be used affectually through any orifice not less than half an inch in diameter

not less than helf an inch in diameter
The advantages of this new cellar-torch will be most.

As the heat generated by the lamp of this cellar-torch is very slight, the appliance may be employed for the examination of vessels containing all kinds of inflammable fields or gases without the smallest risk of explosion. Each torch may be fitted at will with of explosion. Each torch may be fitted at will with an oblung or clreduar mirror, which is serwed to the extremity of the appliance beyond the lamp. Upon beliar passed into the jar or cask, a slight preserve against the side or bottom of the vessel causes the mirror to assume a horizontal position, and by this means a viow of the sacker surface of the vessel is readily obtained. The advantages of this device will readily obtained. readily obtained Tha advantages of this device will be at once appeared to the practical reader, who will readily perceive that by no other means can the whole interior wail of a closed resent be as otheroughly explored indeed, for the thorough examination of the interiors of long staves, bushes, bolier tubes, etc., there is no more perfect appliance obtainable than thighests calinatoris fittle will be reflector of suit-

In conjunction with his patent electric torch, Mr. In conjunction with his patent electric torch, Mr Hagbee has recently introduced another noveity in the thermo-cere or wax-melter. This is an ingenious appliance by means of which a perfectly continued supply of melted sealing- or bettiling-wax may be ob-tained. Like all the most important patents, the apparatus is simple in design and effective in use. When connected by means of the flexible

use. When connected by means of the bettins wire with the source of electrical current; it is held in the left hand—the right hand being porfectly free for use A glick of wax is fitted into the holder and held in place by means of a screw clip. The left thumh (overcoming a spring) presses the wax downward against spring) preses the wax downward against the beating receptace, and hy slightly inclining this the melted wax flows through a lip on to the letter, bothle, or other object which is to be essied Of cootres, as the wax maks, the stick shorters, and to complete the melting of the entire stick a slight movement of the hand downward on the handle oundless the thumb further to press the wax until the whole stick is consumed—the wax holder traveling in a list consumed—the wax holder traveling in a

grouped socket. Whenever it bosomes destrable to check the few of maltid wax, the pressure of the thumb is relaxed, when the apring easiest the wax to rise just sufficiently to free it from the heating life. A five of the advantages of the thermodiff unit be summersied, in the first piece, the wax to the contraction of the three piece, the wax to the contraction of the three piece, the wax to be a summersied. In the first piece, the

appliance may be used in the most confined space, and in any circumstances, with absolute safety from the fire risk which is so constant a danger wherever naked gas jets and feerible rubber tubes are employed. Again, the greatest possible economy in the use of wax is obtainable, there being no possithat melting is automatically storfeed the instant that

Wax melter in use, scaling bottle cerk.

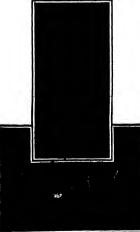

The electric wax

the applicace leaves the hand. No discoloration tha appliance haves the hand No discoloration or smoking of the wax is possible, and the most claim-inately littled sealing-wax will remain perfectly true to the original shade Flashly, the sealing can be receded to the continuously, and in any position, the appliance needing no perfuliancy properation, while all spin-ing or dropping of the wax is entirely avoided. The thermoever may therefore be used for sealing the term, possible particles of value may be to warde left in close proximitive without the activities of the water left in close proximitive without the activities of be safely left in close proximity without the slight-est risk of their catching fire

The New Agricultural Fortilisers The manufacture of fertilizers is one of the most

with the exploitation of the nitrate

The flevible electric celluntersh.

Colleg-torch heads, showing lump and mirror (detached). NOVEL RESOURCES APPLIANCES.

bein of Chile and the potash deposits of Stassfurt, is now in a critical stage of development, owing to the increasing production of nitrogenous fertilizers by the fixation of atmospheric nitrogen, and also to the resuits of recent experiments on the fartilizing effect of extremely minute quantities of totally new agents. The properties of both classes of these new fertilizers are briefly described by Rané Vallier in Revue de Chimia pure et appliques.

NITROGENOUS PERFELIERS OFFAINED FROM THE

ATMOSPHESE.

Nitrates Neutral nitrate of lime, containing 13 Mitrates Neutral nitrate or time, containing in per cent of nitrogen, has been manufactured at Notedden, Norway since 1905. It is an excellent fertiliser and equal in all respects to Chito nitrate it can be mised with superphesphate without causing apprecies of nitrogen or retrogradation of p acid its hygrometric character makes its applica-tion somewhat inconvonient, but it possesses, in con-trast with Chile nitrato, the advantage of adding to the soil lime, an indispensable plant food, instead of sods, the accumulation of which may be injurious to

It appe es probable that Chiis saitpeter for long, be suppliented by nitrates obtained from at-mospheric nitrogen. The Birkeland Eyde and other processes now in use are commercially practicable in their present form, only where water power is cheap, but these processes are susceptible of great improvenut these processes are susceptible or kreat improve-ment An efficiency equal to that of most other pro-cesses of industrial chemistry would make it com-marcially feasible to produce nitrates everywhere At present the nitric acid obtained from the air is nautrailsed with time, while most of the world's produc-tion of sniphuric acid is smployed in the manufacture of superphosphates. If this nitric acid could be used of superphosphates If this nitric acid could be used to convert the tribusic selectum phosphate into the superphosphate an enormous saving could be effected and a fertilizer produced which would contain both soluble phosphoric acid and nitrogen in a form sultable for assimilation, and would drive every of nitrogenous or phosphated fertilizer out of

The difficulty of applying the light cyanamide powder has been overcome by adding a sittio water, which combines with the quicklime of the crude cyanamide and forms a coarse powder called granulated cyanamide which is much m venient in use A still better form is oil cyanamide, venient in use A still better form is oil cyanamide, made by mixing the fina powder with 4 per cent of crude petroleum. The proportion of nitrogen in com-mercial cyanamide has been increased by improve-ments in manufacture from 15 per cent to about 20 per cent, that of pure calcium (yanamide being about 35 per cent Cyanamide has now fairly entered into agricultural practice. The trust which controls the sale of the product in Germany and Italy sold 3,000 tons of evanamide in the first half of last year

Calcium cyanamide (CN,Ca), Irested with water and carbon dioxide yields dicyanamide (CoN,H_s) in and carbon dioxide yields divanamide (CA,H,) in the form of nearly insoluble colorisas crystals, which contain 68 per cent of nitrogen and form the richest nitrogenous fertilizer ever produced in some cases the cost of production of divanamide may be combonbalanced by the economy in transportation Applied to wheat in the quantity of 30 or 40 pounds per scre, it has produced excellent results

Guillin has proved that more than one-fifth of the diffine has proved that they was not amount in the hitrogen of rynamide is converted into ammonis in one week and more than one-third in two weeks, by the action of soil moisture Musentz and Notite observed in two months a production of nitric acid corresponding to 11/12 of the nitrogen of the cyans-

responding to 11/12 of mide added to the soil

mide added to the soil
The poisonous action on plants which was at
first attributed to cyanamide fortilizers appears to
have no existence or to be due to impurities The
germinating power of wheat treated with pure Cynamide or dhynamide is not diminished but is sometimes increased Munit and Notth bowever, observed a tomporary arrest of growth after the application of cynamide in bot dry wonther, and therefore advise the selection of a wat period for its application.

11 PERTILIZERS CONTAINED MAYONTEES HERDINGS MAYONTEES WHITE ADDITIONS OF THE ADDITIONS OF evanamide or disvanamide is not diminished but

disatases which are the principal agents in vege-table aynthesis. Nagaoka, in Japan applied man-ganese sulphate to rice plantations in quantities equivalent to from 16 to 50 pounds of Mn, on several serva, and obtained increases of crop of from 25 to 25 per cent. The beneficial effect persisted as assallest extrest, through the following year Man-mans absorbed as most account of the obstacles.

in Europe, Vocicker and others have obtained in The Europe, vocation and others have obtained in-receases in the crop of wheat up to 20 per cent from the application of from 25 to 50 pounds of managaness sulphate per acre Excessive dosos (100 pounds) dim-luished the crop Similar results were obtained with

Grégorie, Hendrick and Corpiaux observed little benefit from the application of manganese to suga ots, but Gasola obtained facrements of 46 per cent in roots and 26 per cent in sugar from mangane chloride and of 24 per cent in roots and 65 per cent in sugar from manganese sulphate—the chloride dim-inishing and the sulphate increasing the richness of the fulce

With flow (lurate obtained the enguriator increase 54 per cent in totally dry weight from mangane bloride, and 31 per cent from manganese sulphate He concludes from his analyses that the mangane and continues from his nanyays that the manganess applied is assimblated by the plants and that the dif-ference in molecular weight of the chloride and sul-phate determines the degree of influence on the formation of dissiances

But the effect equact be wholly due to the man gameso which is assimilated, for Borirand found no had been increased by manganese, than in the trol plants to which no manganese had been applied traj plants to which no mangameso had been applied And recent American copyriments have proved that fertilizing agents act parity by destroying the toxins tell in the soil by the preceding crops. Unstable man-gamese sails might be expected to promote the oxida. tion of these toxins Manganese exide, traces of which occur in most soils, is entirely inert. The greatest proportion of successes has been obtained with man ganese sulphate.

III KTIMULANTA AND POISON

American cuprimus term have revived the old theory of De Candolis, and proved that intertilly may be despected that intertilly concerns that intertilly near be despected to the concerns that intentilly concerns that intentil of these executions or prevent there consider these executions or prevent there formation. Unpure Rails The salts of copper have long been employed for the improve of developer have long been employed for the improve of developer have long been alies of the trape, and fields of young grain can be offered of certain maxious weeks without highring the grain plants by surging with a 5 per cent solution for counter submission 2010 for centry Bridal have a controlled to the counter submission of counter submission 2010 for centry Bridal habits 2010 for centry Bridal habits 2010 for centry Bridal habits. of comer sulphate Quito recently Breal has in creased the yield of make by from 27 to 86 per cent by soaking the seed corn in a copper bath and then drying it before planting. The bath was composed of 3 parts by weight of copper sulphate, 30 parts of starch and 1,000 parts of water

Eisc Javiller, Inforring, from the presence of sine in many plants that this metal must perform some function in vegetable physiology made an extensive serios of experiments which proved that infinit quantities of zinc promote the growth and multiplication of mold and yeast fungi and some chlorophyl-bearing plants. For example the growth of a certain pearing plants, for example the growth of a certain moid was stimulated by cultivation in a medium con-laining I part of aine in 50,000 000, the maximum increase was produced by proportion between I in 10,000,000 and I in 25 000 and still stronger solutions exerted an unfavorable or toxic influence. Mk heels and De Heen find that sine saits promote the germina

Also The large proportion of alumina found in the ash of criain exotic plants (more than 50 per cent in the Australian Irve Orites exvelues) led Yamano to try the effect of niuminous fartilisers Common alum, added in the proportion of 1/5 per cent to the water in which young barley plants were growing quickly kitled the plants, but proved much less injurious to bariey growing in the ground A distinct fertilizing effect, manifested by increase of crop was observed to follow the application of 1/20 per cent and 1/500 per cent solutions of ammonia aium to barley and flax the effect of the ammonia having been carefully eliminated

Hagnesia. The presence of magnesia in all plants

and in all soils long ago suggested the employment of magnesia as a fertilizer Tribot's recent sludy of magnesia as a fertilizer Tribot's recent study of the influence of magnesia in the transformation of se proves that magnesis can act as a ferment. Magnesian fertilizers were formerly employed, to some extent and with good results in recent experiments magnesia has been found to increase the crop of grain pointoes and bosts chiefly by promoting the assimilation of nitrogen

Brownine Aso finds sodium bromide stimulating is

Brumine Aso finds sodium bromide atmulating to very annial doese and poisonous ta larger doses to beans growing in pois One part of bromide to 50 million 5 million and 1 million parts of earth pro-duced increases of crop of 53, 48 and 29 per cent, reapectively

lodine and Fluorine Potassium lodide, applied in dilute solution, appears also to act as a simulant or a poison according to the dose. Aso and Susuki obtained a large increase in crop of rice from about 140 pound of the sait per acre int very little increase from 14 pound white Holizung distinished the crop of augar beels by one-fourth by applying about 410 pound per sore. Analogous results were obtained by the same experimenters, with sodium fluoride, applied

the same experimental to the same erops.

Rere Riements Cerium, like manganese, appears act as a forment Aso finde thorium rather injurie than beneficial to vegetation Nakamura has increase to 70 per cent, than beneficial to vegetation Nazamura are autocar-tha yield of rice, growing in pots, by 70 per cent, by mixing with the soil 1 100 000 of its weight of lithium carbonate, but a dose 10 times greater produced a maller increase (65 per cent), cassium carbonate, in the same doses produced increases of 1914 and 9 per

TV PACTORIAL SEPTEMBER

The discovery of the mechanism of nitrification and the fixation of atmospheric nitrogen by the bacteria of root modules, soon led to attempts to aid the process the addition of nitrogon-fixing bacteria. Nobbé and Hiltner patented a process of inoculating Nobbé and Hiltner patented a process of inoculating peas and boans and the soil in which they grow by soaking the seed with an infusion of a galatin culture of the bacteria of the root nodules. Bayer offered pure culture of Ellenbach's bacillus, inixed with potato pure culture of Fillenbach's bacillus, mixed with poster mest, but Macrker soon concluded, from the contra dictory results obtained, that the preparation had failed to prove its value. In 1804 the United States Duran of Agriculture distributed 12,000 boxes of Durwal or Agriculture distributed 12,000 boxes or bacterial cultures, which appear to have produced good results. In the majority of cases But the effect of these preparations is uncertain, as the abrupt change of medium may awrit the develop-

ment of the bactoria. The soil naturally swarms with nitrifying bacteria, but their growth may be checked by various causes which will have the same effect on the few millions that are added Stocklass has endeavored to obtain hardier varieties

by cultivating the bacteria in a large mass of earth, and has obtained remarkable results, but in view of the uncertainty mentioned above, it is prudent to defer indepent until several more years of experi-

THE VALUE AND THE PUTURE OF THE NEW PERTILIPERS. The value of the nitrogenous fertilizers obtained by artificial methods has been abundantly and decisively d, but the same statement cannot be m regard to the other new ferlilizers wery one of which has given contradictory results in the hands of differ ent experimenters. Similar nucertainties, however, attended the earn experiments with other chemical attenties are early experiments with other themless fertilizers the value of which is now universally rategorized. We have learned how to use nutrient furtilizers and we shall learn how to use stimulants. And this knowledge will be productive of incalculable benefit to agriculture.

Charcot and the Anterette

Lest anyone should suppose that Dr Charcot went to the Antarctic lergely for the purpose of reaching the pole it may be said at the out the pole it may be said at the outset that his chief chief was one of signifite research only He only reached latitude 70 degrees, and therefore can hardy compare in netherament with his proferensary, and notably with Bhatkiefon and Srott. What he did was no explore a region of archipolages and waterways, of which very little is known, and to broaden our knowledge of an ice barrier which extends westward from the South Shettand Islands subroken Although Dr. Charcor roturns with nore of the laurels of Shackiefon and Scott, his explorations will be of much assistance to fature Antarctic explorers

be of much assistance to inture Antarctic explores From the mager account of his findings it won seem that any attempt to approach the pole by way of the straits of the South Shatland Islands is doomed of the stratis of the footh Shakhad Islands is doomed to failure, and that Cummander Fearry pike of a tacking the pole is a direction opposite to that pursued by Shackelon is hopeless. So far the only starting point that holds out any promise at all is the base of Roard is be barrier, where the volcanoes that the base of Roard is be barrier, where the volcanoes that of the factor are to be found. Here and here only one an expedition winter not mere than a few hundred miles from the pole

The Current Suppl

The current Supplement.

The current Supplement, No 1782, contains some very striking illustrations of the Paris flood, which show to what extent the current paris flood, which show to what extent the capital of France has suf-fered from the inundation. Mr H F Stimpson contributes an excellent article on efficiency in shop opera-tions, in which be shows how shop efficiency can be creased, as well as some results secured by the cibeds which he advocates. Mr Claude Grahamemethods which he advecates. Mr. Claude Grahams-while, in an article "Some Experience of an Ari-ator," hotebes his own experience, and thus shows many an anging artister what he has to avoid. An-other paper on explosives for use in cost mines by Manroc and Itall is presented. The second and cos-cieding insistiment of the article on the Wright in-pared on the second of the article on the Wright in-pared on the second of the second of the second and he specially contained to the second of the secon he pays a Iribute to that great man's engineering abil-ity. When the Nobel Prize was awarded to Mr. Marconi, he read a paper at Stockholm, in which he sum-marked the recent development of wireless talegraphy. That paper is published in the current Suppumment.

An Injunction Agein

An Esquession Agelmot Fundham,
Indeg Hand, In an opinion find in the United States
(Frout) Court, granted the injunction predests title
stated for by the Wright Company against Louis Paulhan, the French aviator, alleged to be using in his exhibition fights bere a machine which is an infringament of the patents granted to Orville and Wilbur
Wright. This decision prohibits ar Fundhan from
using his machine in this constrip-pending the trial of the Wrights' suit against him.

the Wrights' suit against him.

After discussing the prior discoveries cited by the
defense, Judge Hand in conclusion says

"It is, of course, unusual to grant a preliminary injunction before any adjudication and without any
sequisecence However, when the right is not seriously attacked, and when the infringement is clear,

the court should not hesitate to interfere
"From the showing made I cannot doubt that the
complainants first put into any practical form the system of three-rudder control. That there may be othe systems is not the point, let the defendant use those if he will Nor is it necessary to conclude that the complainants were the first to fly Upon that I decide nothing whatever, for it is not an issue in the case. "All I do say is that I cannot find that anyone prior

and that the changes from the specifications which the defendant had made are no more than equivalents which do not relieve from infringement.

which do not relieve from intringement.
"It is quite clear that for the complainants' protection a writ must go pendonto Hic, because the defend ant, being a non-resident, who is here transiently, there is no way in which they may insure themselve. of the monopoly they have acquired except by p ing his use of it at once

A Library in the Sahara.

The French Colonel Gaden, who recently led an expedition into the southwestern region of the Sabara, found in the course of his investigation that one of the most powerful princes there, the Shelk Sidia, was the next powerful princes (nert, its Sans; Salas, was the founder and possessor of a rather large illerary, a report of which is published in the latest number of the Revue du Monde Musulman Tiple library is small, indeed, when measured by our ideas of such a founda-tion, for it contains only 683 books and 612 manuipts Still it not only preves that a most urgent ed of books has selzed the most distant outpost of

scripts and the most distant outpost of most of both has selesd the most distant outpost of most of both has selesd the perceived lively laterest in consequence of its composition. Approximately the books composite thirty groups relating sepacially to koranic crudition the decrine of latth, history, jurisprudence philotopy, travel and discovery, poetry and fettion, married life, magio recipes, wherevertaint on dreams and sarriedny. The limits of the married life, may be composed to the contract of the married life, may be composed to the contract of the married life, may be considered to the contract of the contrac interpretation of dreams and astrology. The libratherefore, bears the impress of sheer orthodoxy, wh is further manifested by its lack of books from for-bidden provinces, such as philosophy and the natural sciences, but airrady the existence of printed books, scilon of which is deemed a rigorous contra diction of the strict tenor of the Koran, proves that the revolution in the production of books, which began in Stamboni toward the end of the eighteenth century, in Stamboni toward the end of the eighteenth century, has to-day acquired citizenship in the whole islamitic world, and that at no remots day also in this circle of culture and of passionate political aspiration and arbitrement the printed book will force the written arbierement the printed book will force the written book into a very dim background Islam, long ob-structed by orase ignorance of many foreign things cleed a most beneficial force of the province of the cleed a most beneficial flower on the daily life, is now quickneed by the frequent book in its own tongues, which comes galloping from European publishers even into the precincts of its haughtiest orthodoxy. The printed book is already an irrestitible leaven in Islam,

Booth of Altred B

Altred Spear of Passalo, N J., died at his home in his 87th year He was one of the first who ever con-ceived the idea of a moving sidewalk. His model in-terested such men as Peter Cooper, Horace Greeley, and several other prominent men. The scheme has so much to commend it that two Legislatures, those of 1873 and 1874, authorised the use of his sidewall but the Governor of the State veloed the bills.

liveness of the Telephone

Proces has calculated that an audible sound is pro duced in a telephone by a current of 6 by 10-2 am peres, and Pelist has calculated that a sound is produced by a difference of potential between the two sta-tions, amounting to only 1-2000 volt. These statements tions, amounting to only 1-2000 work. These statements give some idea of the great sensitiveness of the most are telephone, but the sensitiveness of the imman our, which perceives the invasible vibration of the telephone displacement, is no loss requiripable.

Correspondence.

WORD A TRACLING GAR REVERSED ITS POSITION.

To the Editor of the Scherttin America.

To Ismany 50th, 1916, about 13.40 P M, a curious and unique socident happened in repart to limited car No 130, D. and F, at the crossing of Main and ash Streets, Piqua, Ohio. The phenomenon was so remarkable that I have concluded to make this report of it, and if you see fit you may lay it before you

readers.
The car was headed south on Main Street, running perhaps ten or twelve miles per hour. At the switch in Ash Street, where consection is made with the city line, the rear truck left the main line and followed the Ash Street line, and the car body turned completely end for end, returning almost completely to the main line. Nother truck was at any time off the ratia and erest the truthey wheel was still in work ing contact with the over-head wire when the car ing contact with the over-boad wire when the car stopped The brake rod connections were all stripped and torn loose, also the wire connections from con trollers to motors were severed. No one was sariously injured, and a casual observer coming on the seeno, as the writer did, a few minutes after the occurrence ould not notice that anything out of the ordinary

had transpired

The attached diagram shows five positions assu-The attached diagram shows five positions assumed by the car in its wonderful evolution. The relative position of the truck with reference to the body and also to the tracks is shown, the end of the truck normally positioned toward the center of the car body being indicated by o and b The end of the car headed south before the accident is indicated in each figure

Fig. 1 indicates the status of things when the truck

ee in the Himalayas and who stated much experience in the Himalayas and who stated to Prof H. O. Parker that the amount to be allowed for retraction on high snow mountains was most un-certain, that therefore the altitude of the great Himalayan peaks, though given in precise figures, was still in donbt

tempted by the Dike of the Abrusti, was made by a friend of his, whose allowance for refraction was deuble what he thought should have been made. With the smaller allowance IX would be about 4000 feet higher than it is now regarded. It similar allowance for refraction is most on Husseatia, it may easily hap-pen, especially in a country with a much drifer atmo-phere than facing that the thought of the pro-pered that the three three three three three three pulses than facing that the three three three Accordingly while it is perfectly proper for all who desire to do so to accept the figures of the trinapula time, regardless of the careful cultural of mayelf and

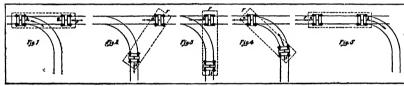

of the Swiss guides and of the evidence of the photo-graphs, no one need feel obliged to accept those figures es Anal

As to Aconcagua being the highest of the Andes. I may say that aside from Hunsearan there are several mountains which may prove when carefully measured to be of greater altitude than Aconcagua

in this connection it may not be wholly out of place to say that white Mrs. Fanny Bullock Workman has. according to the newspapers frequently announced her readiness to furnish evidence of the attitudes claimed hy herself, whon I wrote to hor stating that I should be glad to see the figures of her observations, an in terest shared by some other Alpinists she informed me that they had not been published in any of her The Harriman is a special 4-cylinder motor of 50 horse-power and weighs 200 pounds 1t bas copper water jackets and aluminium crank-case The bore and stroke are 5 inches. The 5-cylinder V type motor hes se and cylinders cast of macadamite erank-case and cylinders cast of mecadamits. The cylinders are lined with cast iron and the plutons also are of a special grade of this metal. The bore and stroke are each 4 inches. The output is 50 horse power at 1,300 revolutions per minute. The 12-cylinder Vtype Buffum motor is constructed similarly to the Easton each row of cylinders being cast in one piece with the upper part of the crank-case and afterward being bored and lined with east iron. This motor is beautifully finished Its weight complete is hut 415 pounds, and an output of 100 horse power is claimed for it at

and an output of 100 horse power is claimed for it at 1 800 revolutione per minute Upon entering the large main hall of Mechanics Building the visitor saw upon his right the Bierlot and Antoluetto type monoplanes of the Scientific Aero plane and Aliship Company of New York The former of these machines which is fitted with a 4-cylinder air cooled 2 cycle motor has lately been experimented with open he by Mr Stanley Y Beach and he in a fair way of making a flight in the near future. The Antoinette type monoplane was shown with a huge red 9-foot pro-peller of special design, which has been found to be peter of special orsign, which has been found to be very efficient A novel type of stevering goar having two superimposed wheels was also fitted. Opposite these two machines were two Wright type hiplanes of Frederick P Schneider. The finished one of these two machines had movable daps upon the rear edges of the wings instead of the warping arrangement use Wrights.

reeding onward around the hall, the visitor next saw two new monoplanes—one (the Morock) a small demountable Bleriot type machine having wings laced upon steel tubing and the other (the Burlingame) a

b is about to turn from the main line. Figs. 2, 3, and 4 ow intermediate positions, and Fig 5 the car when it came to rest Pique, Ohio. E B RAVER

(The mere momentum of the car would not account The mere momentum of the car would not account for the return of the car to the main line. The fact that the trolley wheel remained on the line suggests that the motorman must have reversed the rear motor, which acted to push the car back in the reversed post tion to the main line.—En.]

MISS PROK REPLIES TO MES. WORKMAN. To the Editor of the Scientiffic American

Having observed in your laste of February 12th a letter in reference to the sittitude of Mount Husscaran and my record from Mrs. Workman, may 1 state my own position a little more definitely?

After making the ascent of Mount Husscaran, north peak, September 2nd, 1908, of which I brought back absolute proof in the shape of photographs, I gave my reasons for believing the mountain to have an altitude of 24,000 feet, although on account of the bigh wind had been nuable to take hypeometric observation

on the summit. ally, I did not expect the scientific world o

ASSUMANCE, I did not expect the scientific world or suryone else to regard my estimate as an exact measurement. If anyone did so, I cannot be responsible it was, of course, quite within the province of any one to take so great an interest in the matter as to spend some thousands of dollars in sending engineers to Peru to make a triangulation of the mountain and

publish this as the absolute height of Husscaran There is, however, something to be said in regard to the accuracy of such triangulations. Permit me to quote from the recent work of Mr A. L. Mumm (of the English Alpine Club), "Five Months in the

Himstayawa"
"The results of triangulations do not always agree and even when they peculically onlinds, they cannot be accepted an absolutely insupervalsable. There is used researc to suppose the property of the property of the property accurate and feet be allowances useds fore it to be perfectly accurate and the higher and more research the summit, the larger is the possibility of everor. Barriag these facts in saids, it will be possible to be a supervise that the saids of the possibility of everor. The property is the possibility of everor has a summer of the property in the possibility of the and will have a still the loss the same to what premare as that its Longitud (who made has according and will have at at that Longitud (who made has according and will have at at that Longitud (who made has according to the very line a good apportment to establish the recent of a problemour.)

writings, nor did she offer to give them to me per-sonally Anny 8 Pack

New York, N Y

The Acronautic show at Boaton.

The first exhibition of aeropianes, balloons, and sero nautic apparatus exclusively to be held in the United States was held in Mechanics Hall Boston, Mass, from the 16th to the 23rd Instant This first Act Show, although fairly representative of the different experimenters, was somewhat of a disappointment in that there were no motor-driven heavier than air ma that there were no motor-driven heavier than-air ma-chines exhibited that have artually flown, while 60 per cent of the power machines were shown without mo-ters. This fact however, did not deter one from get-ting a good idea of the design and construction of the

proplanes proper
The question of reliable light weight met sonable price is still a hurning one, and a fortune awaits the man who will produce such motors—of 25 and 50 horse-power respectively—to supply them to aviators upon easy terms. Eight different makes of motors were on exhibition, three of these (Curtiss, Cameron, and Harriman) being of the 4-cylinder cycle type, two (Waterman and Duryea) of the 4-cylin der, 2-cycle type, and two (Easton Cordage t'ompany and Buffum) of the 4-cycle, 8-cylinder and 12-cylinder V (type respectively An Elbridge 3-cylinder water-cooled type respectively An Elbridge 3-yillader water-cooled 2-yile motor was also shown on the Wright type hi plane of F P Schneider The £5-borse-power 4-cylin der Duryes motor which was shown npon the Bleriot type monoplane of Stanley Y Beach, is alrecoled by type monoplane of Stanky Y Beach, is alrecoled by means of this copper strips where to the cylindors. The Cameron motors—a 4 and a 6-ylindor of 30 and 45 horse-power respectively—are also alrecoled with the usual cast Sanges. The smaller of these two motors and the Duryak motor both weight about 300 pounds, or approximately 50 pounds more than the Curtiss 32 of water-coloid motor with reduktor and water. The reason for this apparent enperiority of the water-cooled motor as regards weight is found in the fart that the motor as regards weight we found in the fart can the Curties is a specially constructed acronautic motor, whereas the air-cooled motors mentioned are simply antomobile motors adapted to aeronautic use and not injetteed nearly as much as it is possible to lighteen them. The same may be said of the Elbridge, which is a marine motor The Waterman, another lig rise motor built for canons and dories, weighs just under 100 pounds complete with flywheel, which can be dispensed with, and develops about 15 horse-power

large monoplane with trussed inclined struts running from the bottom of the wide central frame to the er of the wings A 56-horse-power Harriman motor, di-rect-connected to a large and thick propeller, was placed at the front of this monoplane

placed at the front of this monoplaw. A hijianc hat attracted considerable attention was that of Victor Pape. This had a rectangular central today and extremely thick wings with a deep currature. A novel revolving cylinder Acycle motor the L. A. W.) was prived in front, so the propelier monoided upon it could be directed upward or downward. The laxyward and Kritkens bilbanes were construct.

ed entirely of bamboo In general outline they re-sembled the Curtiss, as did also the Bisner & Downey sembled the Curles, as did also the Elsaner & Downey and the Read machines "The Erickson biplane had a tulick automobile motor weighing 240 pounds fitted, the weight of the biplane alone being but 220 pounds. This finest piece of construction on exhibition was the Herring machine, both by the Starting Burgess (Conserve as well known by a thuilding concern of Mark.)

Company, a woil known but building concern of Marbishend, Mass This machine, in general appearance resembling the Curtiss biplane was mounted upon three round skids no wheels being used. The horizonial rudder was worked by the aviators feel and the zonial rugger was worked by the aviators need and vertical rudder by hand. A long inclined not was placed on each side of the seat, to while the aviator can cling. Springs were introduced in the guy wires, no turnbuckles being used. The poles that earry the front and resr rudders were all hollow A Curtiss motor with a 4 binded propeller of Mr Herring's design motor with a 4 binors proposer of Mr Herrings design was fitted. The machine complete weighted less than 400 pounds. The propeller is said to give 260 pounds thrust, which, it is claimed, is ample to start the ma-chine on any ground on its skids. The stability device

thrust, which, it is claimed, is ample to start the ma-chine on any ground on its skids. The stability device for lateral squilibrium was not; shiblind. There were also several glidter on view, and a large number of models of all kinds, most of which were hullt by boys. The schibilion as a whole was a venter creditable on The cathilion as a whole was a venter. will soon catch up to Europe in the aeronautic industry as it did with the autom

THE COCHIN FOREST RAILWAY

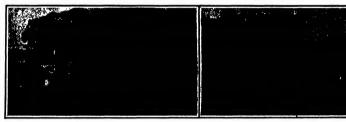

BY EDWARD HARRAN

The Cochin Forest Tramway is an interesting little line of tramway on the meter gage in the semi-inde-pendent State of Cochin in South india it runs alightly to the north of the 10th parallel of latitude and to the east of the 75th parallel of longitude, and owes its origin to the fact that the forests of Cochin owes its origin to the fact that the forests or Occurs form one of the most valuable sasses of the State, their approximate area being 505 square miles, or nearly one half of its entire extent. Their commercial importance it is steled, was vaguely realised as far-back as the beginning of last century, but the earlier back as the beginning of tast century, and the earner attempts to work them were of the usual spasmodic and unsystematic nature which characterized original efforts in forestry throughout the Indian peninsula. In the year 1835, however, a regular forest depart-ment, under the control of a European officer, was d and worked for some sixty years on old fash-lines Though the department throughout this period brought in a certain amount of revenue to the

fact that a land route, provided means of transporta-tion over it were available, would tap a far richer forest area than a proposed river route alone, while, of course, it would be open all the year round. So it of course, it would be open all the year round. So it came about that the ides of a transway in three sections arose, was recommended to and sanctioned by the Durbar The first section was to cover a distance of 8 miles in the valley, to be followed by a self-acting inclined transway 5,000 feet long. The second section, 4½ miles long, was to be followed by a self-acting inclined produced to the Karumani River, from which point timer could be founded to the railway station at Trichar during the monascent period and According to the first processing the second section. The second section is the second section of the sect According to this first propounded scheme, timber from the hitherto unworked Parambikolam Forest was to have been foated by the Parambikolam River to the tramway terminus in the valley A visit paid by his

logs both at the head and floor of the slide proved ex-pensive. To remedy this latter, the conversion of the slide into another self-acting incline was decided upon. side into another self-acting incline was decided upon. To remedy the first, Mr. Alvar Chesty recommended, and the Durbar anactioned, another extension of the transway, one of 15 miles to Chalakudi, to meet the Shoranut-Gochin Reliway at that station, a connec-tion, with the acquisement of the Madras Railway authorities, being made between the railway and tramway there.

transary there. To day the total length of the line as it stands computed at the time of writing is 4½ miles divided hise three sections. The first section extends from the 10 to 21, the second from mile 31½ to 37, and the third from mile 310 to 1½. The first and second second are connected by a self-secting wire rope manipolated double way of 1½ miles, while the second and third sections are similarly connected by another incline a

State, there was little or no pretense made of admin-istrating the forests on aclentific principles, with the more or less natural result that while the interior of the forest area (from which there were no facilities for transporting the cut timber) remained practically untouched, work being confined to the more accessible portions and those from which transport was easy it was not until the year 1895 that a more for the better was made when suggestions were made by the Resident, Sir James Thomson, which culminated, early in 1897, in the Medras government placing at the dismi of the Cochin State a British forest officer, Mr possition of the co-can cause a prignal forces outcome, and Foulkes, for the purpose of inspecting the forcets and formulating proposals for their better and more profit-able administration. This gentlemen's report in-cluded the recommendation that the services of a trained and experienced forcet officer be obtained, and, acting in accordance with this suggestion, the Cochin Durbar obtained from the Madras government the loan of Mr V Alwar Chetty TFS for a period of seven years. His first care was to inaugurate a period of rest for the overworked area of timber and to set about securing a suitable outlet for the prospective out-put of the then virgin forests. Surveys disclosed the

Highness the Maharaja of Cochin to the Parambikolam and Nelliampatty forests in October, 1903, suggested a revision of this scheme which provided for the extension of the proposed tramway to Paramhikolam, an additional 12½ mites, the experience gained during the preceding year or two having shown conclusively that the Parambikolam River could not be relied upon

that the Parambikolan Rivar could not be relied upon to carry every year anything like a year's full yield of timber A survey of this extension was made by Mr Haldwell, a specially engaged engineer, in 1964 According to the original soluens, the traction of the timber trucks was to have been by manual labora-but when the length of the proposed line amounted to the timber trucks was to have been by manual labor, but when the length of the proposed line amounted to 31 miles, it was recognized that manual labor would prove both too expensiva and too laborious, and in Suptember, 1904, indemotive engines traction was fassily decided upon. The modifications of the original scheme siready almodd to accessitated a full reconsideration of other portions of it, chiefly the pre-consideration of other portions of it, chiefly the preposed combined river and read transport which it was anticipated would not clear the accumulations of timber Also in practical working it was found that a timber alide, especially in the case of lengthy, and heavy logs, was unsatisfactory, and the handling of Throughout its whole length the Cochin Forcet State Railway is excellently constructed. The gage is 1 meter; the average gradient of the line 1 in 80 and the maximum gradient 1 in 2.5 which gradient occurs on tha third of the five inclines which have been embodied in the construction

embodied in the construction
The inclined ways are so constructed as to be selfacting, and three of them are situated in series between 31 and 33 miles and the other two between 38½
and 33% miles. They are worked by means of wire
cables controlled from brake houses by gear brakes independent of each other, and consisting of horizon vibecia round which the cables pass two or three tim The inclines are double railed with suitable ero The inclines are double valled with seitable crowner points at the up-full side of each brain house. The points are so arranged that a descending lead, which turved solve by force of gravity, requires practically no up-full significant the locomotive planes the truck, which no being moroupled is then ready for the descent. In some cases, however, empty trucks going to the plane to be hand-chusted after being placed, in order to place them: on the side of the upper distillation within the rection rept being. The Art of the CoverBweller.

A very noteworthy discovery of cares which has brought for the discovery of cares which has brought for the discovery of the discovery discov

On a second engraved piece of bone a jawbone that was found in the third layer of sabes is pictured with a contour of almost straight lines a wiid boar of which the head is almost triangular the tunks of which the head is almost triangular the tunk-being riestly drawn the eyes and ears being finitly indicated the bristles on its back appearing with per fact distinctions and the cut in its cut being rither indistinct. That the artist of the cave sought to re-produce the supect of nature in which he had often seen and siain the wild bear is shown by the high gream in which the animal stated and which is repre-sented by strong incisions. On a thinthoon is easily recognized the head of a sea turned with any and desp-y elast mouth the scales and folds of the sain re-indented here or a twintering dynam for and not far indicates of years, whereas and above the nead is a sufficient hint of a fluttering dragon fly and not far from it are tufts of reed. The two last engraved places of bone the Professor attributes to an early settlement in the new stone-age while the awkward portrayal of the man may be considered as derive! from the old stone-age

While the layers of ashes contained a generous num ber of finely worked tools of bone and pieces of orna-ment, the occurrence of relics of man himself is re-stricted to two sketetons with additions from the

eral fishes but the most striking results have been cheral dakes but the most striking results have been to intoned with the gray preb which lives hid yo on a maint situry; but deardine. Some of the a set taken and colored for and were live is that to it make when the pretty was with asserted oils; after-colored sar-ticles and the set of the set of the set of the isr'd and sation but it was not till hongry that the isr'd made a fentiative meal of one of the r d oil of victims on recogniting the sar lite flave; however hap recognity demolsh; it is r mainter 9 stacquently the specimens in the tank decour it the sardines irre-spective of color thus showing not only true so for accounting satisface to consider the satisface of the satisface accounting satisface to consider the satisface of the satisface. sequently sardines colored red and blue were pia ed in the tank together with the silver on s the came in the tank together with the silver on a th came, seen was represented the blue ones not hing size and till the others were sealen and hunger compelled in vestigation of the new content. After this introduction the perch ate the sardines of all the ryps with out any difficulty. Some spines of the sea nit! (as tinia) were then fastened to the blue sardines these were at once avoided by the perch who ry multiple out of the way of the peer country. This showed traces of memory as the results of content with the sea nettle were clearly shows and recognised.

THE NEWLY DISCOVERED GOBLIN SHARK OF JAPAN

BY DR. L. HUSSAKOF

Every now and then the zoological world is startled by the annuancement of the discovery in Japanese saters of some very rare or very ancient type of animal. So often is this the case that coolegists have come to look upon the deep waters of lapan as a sort of naturalists wonder restme a preserve in which five all manner of interesting animals some of them of an archab type long extinct in other parts of the The expectation of remarkable discoveries in these waters is so strong that I have heard a distinguished Annual was continued who is himself well sequelated

Inputese waters say that he would not be greatly surprised to hear some day that a real Mossesaur or ichthyosaur had been hooked in the depths of Auro Sharo or warm Illack Current of Japan

It is in these waters that Japanes ishermen occusionally take on their lines a shark whose grotesqueness has won him among natives the name of Tragagase or gobila shark One of these "gobilas" came into the hands of President

David Starr Jordan of Leland Stanford University a cozen years ago and was at once recognized as an Interesting at hak typs whose close relatives had long since become extinct. President Jorden described it under the name of Mitsukuring osostoni—the name being given to honor at the same time the late Prof kakichi Mitsukuri who for a quarter of a century was the leading light of Japanese zoology and Mr Alan Owston, a majural history desier of Yokohans, who was instrumental in securing the specimen name, by the way, does not stand at the present day but must be replaced by **Repenorhynchus—a name which had previously been applied to the leeth of the which ind previously been applied to the leath of the extinct speeds of this type of shark found in the rocks of the Chalk period, in different parts of the world in accordance with a lentific usage therefore, tha Japanese shark described by President Jordan st now be known as Scapanorhynchus occatoni

must now be known as geography has occated it is now to be recorded that a second species of gobiln shark has turned by in a most unexpected way II happened thus All of the sharks (aught in Japan in the past years and

sent to the various museums - shout muaeums — soott twenty in all—were A looked upon as be-longing to the same species, if overloss No one had ever thought of comparing several specimens, in so rare in numeums that comparison is generally quite out of the question 1t was therefore a pleasure for the writer to have had the opportunity of comparing several cimens in the coi lections at Columbia University and the American Museum of American Museum or Natural History and to find among thom a new apecles of the goblin shark. This has recently been de scribed in the Bulletin of the American Museum of Natural History as Scupanorhynchus jordani name being

given in honor of President Jordan, our greatest su

given in namer of revenuest jordan, our greatest au thorily on the fish of Japan Now to come to the fish himself As seen in the flustration (Pig 1) the new shark is certainly grotesque, well deserving his sobriquet 'gobijn' The largest specimen in this country is one in the National Museum at Washington measuring over cleven fo Fortunately it is not given to frequenting the bathing-beach, but keeps to deeper waters—usually about fifty fathous As is generally the case with fish from dep-ar water, this shark is soft and pilable. Even after bardesing in a preservative for several months, it can be rolled into a ball. The most remarkable feat ure is the curiously elongaled "nose" jahown in Fig. 2) It is this together with its protruding jaw and amail bendy even that gives the shark that usiv

appearance. The teeth (Fig 3) are sharp and sleuder, each like the pointed and of an awi. They constitute a most effective weapon, which must be fingered. with discretion even on the laboratory table the neculiar anatomical characters, suffice it to say the permiss anatomics in Caraviers, source it only that in the total make-up it is so different from all other sharks that President Jordan was at first in-clined to classify the genus to which it belongs in a special family by itself

As to the differences between the new species and the one already known, we need say only a few words

Fig 1.—The newly discovered gobila shark (Scapanorhynchus jordani).

The pictures show the differences at a glance even to the layman in matters ichthyological the layman in matters febbyological. The new form (thour pitture) is distinguished by a much less pro-truding Jaw, by a very much assuler spirsts (the uninet accessory still prior seen at some distance back of the eye), and by the fact that the eye is situated opposite the middle of the jaw instead of back of it. These features are quite sufficient, in the opinion of repreta, for separating our goodin as a distinct 'kind To the general reader they may perhaps be of interests as examples of the degrees of difference which are used by specialists to distinguish species of fish.

Pipe, Cigarette, and Cigar.
The question as to which of the three form smoking, the pipe the digarette, or the cigar, intro-duces the greatest proportion of nicotine into the umober's existen has never obtained a combistely deisive answer, allhough it has received consider discussion from time to time At one time it was freely asserted that the tobacca which contained the

ter of fact, carbon monoxide is invariably found in all tobacco smoke, and that direumstance should be sufficient to war nall smokers against inhaling it persistently. Theories as to what happens in the combation of tobacco in the various ways it is smoked next took into account the extent to which condenses then predicts were formed and retained in the time products were formed and retained in the properties of the proper length of the stem a comparatively small proportion of these condensation products reaches the mouth In the cigar, on the contrary, the densing process has a te to travel throughout the clear, at all events, as the cigar gets shorter the condensed product area graduthe condensed product area gradually reaches the mouth and eventually the products are conveyed there by the heat of the burning end it has been said by con-

noisseurs that no cigar is worth smoking after one-half of it has been consumed which seems to be cal considerations very suitable for application by millionaires. Again, a cigar that has been partially cal considerations very smitable for application by millionaires Aguin, a cigar that has been partially smoked and then allowed to go out is decidedly un-pleasant when re-lit, owing doubtless to the spread of condensation products to the mouth end. In tha case of the pipe, the burning area is always in the case of the pipe, the burning was is always in the same place, it never comes near the mouth, and therefore the probability is that the condensation products do not reach the mouth in, at any rate, ap-preciable quantities in the cigaretta the condensa-tion products eventually reach the mouth, but there is in this case less chance of condensation products forming since the combustion is unhampered, the tobacco being freely in contact with the air The quee tion of moisture, however, must not be loft out in these considerations, for it is obvious that damp to-bacco will form condensation products more readily than dry tobacco it is probable, therefore, that a dry or elgarette gives off le es poiso

than a damp one does, but not averyone smokes from

choice a new cigar or an old cigarette It is reasonable to conclude that able to conclude that the amount of nico-tine reaching the mouth does not neces-sarily depend on the amount in the tobacco, but on the form in which it is smoked In drawing this conclusion regard must, of course, be had to the quantity of to-bacco smoked, but if the conclusion is corcome first as the local ero smoking, then the eigarette, and last ly the cigar -- Lancet.

It has often been remarked that the centers of sciamic and volcanic activity move volcanic activity more

THE NEWLY DISCOVERED GORLIN SWARK OF JAPAN.

highest amount of nicotine necessarily tonded to be the most injurious, no mantor in what form it was smoked, but we now know that the form of smoking plays an important part. There was a theory that not in all three cases was the original nicotine in the to the sat three cases was the original module in the tobacco conveyed as such to the mouth, sometimes it was destroyed by effective combustion, while at other times pyridine was responsible for toxic effects. According to this theory which was all on the right track the classrets was least harmful, because the tobacca slower the thin pages various was account. eco slong the thin paper wrapper was expose Freely to the air and as a consequence the tolence was well hurst and all incotins was destroyed Against this it was held that in such a case one poince disappeared only for another one to be elaborated, and aerhon monoride was found in marked quantity as a poisonous constituent of cigarette smoke. As a manPletured in the second

Scientific American

PERFERON ARCH.

panying engraving is an arch Protured in the accompanying organing is an arch used more particularly in freproof work, which is of very simple construction. It consists of hut two titled the provided with an air space usually designated as a "vacuum." The usual I-beams be-

-

tween which the arch is formed are indicated at A and B Each arch member comprises a top panel G, a bottom panel D and a side panel E thus giving the member the general shape of a wedge. At the point of the wedge one of the members is provided with a of the wedge one of the members is provided with a tongue F, while the other member is formed with a groove adapted to receive this tongue. When the two sections are fitted between the I beams they are thus interlocked. A weight placed on the interlocked tiles produces an outward spreading thrust against the two I beams A and B To resist this thrust the I bes are braced by means of cross rods, as indicated by dotted lines in the illustration. Our illustration shows part of the upper panel of one of the sections broken away to reveal the reinforcing which, in this case, consists of a notting of heavy iron or eleel wire im-bedded within the material. The lower panel is bedded within the material 'the lower panel is braced by means of bars of inhedded therein which ex-tend up into the tongue F. They take the end thrust and materially attempthen this portion of the arch The 'vacuums' or wedge-shaped air squees formed be-The vacuums or wege-shiped are spaces formed to through the arch in case of fire. A building having a large proportion of such arches is therefore to that extent rendered more nearly dreproof than would otherwise be the case. The inventor of the arch is life Eugene F Fitzpatrick, of 158 Withers Street,

MUFFLER FOR TELEPHONE TRANSMITTERS.

Unless one is using the telephone in a booth or in a quiet room it is impossible for him to exclude all local disturbing noises by stopping the cer that not applied to the receiver, for the reason that the noises reach him by way of the transmitter of his own instrument in order to eliminate all auch dis-turbing sounds a very simple device has recently been od which may be applied to any telephone tran mitter This device is illustrated in the accompany ing engraving it is extremely eimple, consisting of two members hinged together, one of them being a ring-shaped plate adapted to be placed over the mouth of the transmitter and provided with ears which ar bent back ovar the suiside of the transmitter of wire band is then fitted over the ears, and the latte are bent upward and hooked over the wire. Owing Owine

MUTTER TOR THE PROPERTY PRACTICALS.

to the outwardly flaring form of the transmitter the device is thus firmly made fast. Between the ring-shaped plate and the transmitter is a strip of felt which serves to prevent vibrations that strike the which serves to prevent vibrations that strike the plate from being communicated to the mouthplece of the transmitter. The second member, which is hinged to the plate, is in the form of a flat cover provided on the inside with a lining of fait so that when it is closed down upon the other member it will exclude all sound from the transmitter. The hinged cover all sound from the transmitter The hinged cover is provided with a finger place, by which it may be opened whenever one desires to use the transmitter but at all other times it should be closed to orticale local noises. The inventor of this simple attachment for telephone transmitters is William D Plumb, 2022 Lexington Avenue, New York city

WROUGHT-STEEL SASKES.

in this the sanitary age we have come to recognize in this the santary age we have cont. to recognize
the importance of daylight is our work rooms as
well as in our homes. The germicidal effect of sun
light is well recognized. Add to this the fact that
gartificial light costs money, while aunight is free,
and nothing further need be said to demonstrate the superiority of the daylight shop, both from the sanitary and the economical point of view Recently a new tary and the economical point of view "sceenity auctivity type of window sash has been devised for industrial huildings, which, it is claimed, by doing away with the cumbersome frames and heavy mullions makes it. the cumbensome frames and heavy mullions makes it possible to deliver 25 per cent more light through a given opening than heretofore. The sash is of vary simple construction, and yet is much atronger than the common wooden sash. It is better able to with the pressure of the wind, and furnish to a fire It is made of steel bars rolled to the cross section shown in the accompanying engraving. The method of joining these bars is very ingenious and decidedly unique. A small cross slot is made in the

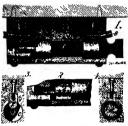

HOVEL JOINT FOR WHOUGHT-STEEL SASHES.

vertical bar (Fig. 2) of the such just large enough to admit the finance of the horizontal bar The moiries part of the vertical bar a them pressed out so as to folds tosety around the moided portion of the horizontal bar, as shown in Fig. 3 in the latter bar a small notch is cut as indicated in Fig. 1 to set as a tock It will be observed that the amount of merid loved in making this joint is infinitesimal bars run without break from top to bottom of the win dow as well as from side to side, making a particularly strong framework, and this permite of using a nuch strong framework, and this permite of using a much lighter section has in possible with a miter joint con struction, so that a great saving in effected in the utilization of the sanh Furthermore, the unusual type of joint makes a break in the monotony of the window sanh which is pleasing to the eye. A patent on this type of sanh has been secured by the Detroit Steel Froducts Company of Defroit, Mich.

SAFETY FURE BLOCK.

Heretofore when fuscs such as the screw plug, ordinary cartridge, or the open wire type, have been used, it iss been customary in making temporary installations, requiring a larger capacity than supplied by the block used in the original installation to remove the original fuse, and to substitute therefor one of larger and in many instances of a dangerously large carrying capacity This has resulted in permitting a load to be intro-duced on the wires which has taxed and in some cases queeq on the wires which has taxed and in some cases broken down the insulation by heat, resulting often in producing a dangerous fire. To obviate such possi-billities the fuse block illustrated in the accompanying engraving has been deviced. It is so arranged as to prevent the introduction between the terminals of a a fuse having a larger carrying capacity than med for the time. The block A as shown in e of a fu

Fig. 1 is provided with a cylindrical compartn opens at one end into a recess B and at the other end communicates through a partition I with a recess ead communicates through a partition I with a recess O. Bach recess is fitted with a lug adapted to receive the terminal wires of the line. The lugs are engaged by screws that pass through the blocks and serve as binding posts to hold the line wires. The lug D in the recess B is provided with spring clips of accurate adapted to grasp the body of the fuse E for P in the opposite recess is also provided with

SAFETY FURE BLOCK

spring clips adapted to engage a boss G which pro-jects from the end of the first. The fuse is provided with the usual metallic contact bands and one end is furnished with a handle H. All of the fuses adapted furnished with a handle H. All of the tuses anapted to be used with a block of a vertain ampere carrying capacity are fitted with bosses of the same size. A fusc of larger carrying rapacity however, would have a boss of larger diameter—if one should attempt to hasert a fuse of larger carrying capacity into the block the boss would fall to pass through the partition I and enter the clip P as shown in Fig 2 and no contact would be made with the line terminals. The inventors of this electrical fuse block are Messrs. A. A. Moffill and G. E. Andrews, of 40 Bridgham Street, Providence R. 1

AUTOMATIC STOCK SALTING DEVICE.

Cattle when housed or running free in a field nee a finited supply of sail to maintain them in good condition if the sail is placed in troughs mixed with feed some of the animals will prevent others from getting a projer amount of the sail. The necompanying engraving limitates a device which affords free access to the sink for obtaining the requisite amount of sali and at the same time protects the sait from the of sail and at the sains time profest is the sair from the elements and prevents want it it is the profession of a und-shaped receptarie which is hemispherical, as indi-sated at A in the illustration A cover piece B is secured to the receptate A by means of servers which are threaded into lugs C formed on the member B l'ile pover piece la aiso hemisphericai in shape, but is cut away at the forward side to admit the muss is not away at the forward side to admit the muzzio of the autimat. A hood D is hilipsed to the cover B and sorves normally to those the opening in the latter At the forward side of the hood is a lip E which pro-jects forward and is curved upward. The receptacies jects forward and is curved upward A is provided with a similar lip F, which however is curved downward thus leaving an opening which will exceed the sait and attract the stock. In use a sufit number of the sait holders are placed in the neight number of the sail noncers are quarcu in the corral or the flith where the stock range to enable the cattle to obtain the sail. The animal raises the hood by showing his muzel beneath the lip E and rocking the hood back until it enanges a long U. When the animal withdraws his muzele for the sail holder the bood will close by gravity thus protecting the sail from exposure to the elemente. Messrs Frank and Thomas L. Peifer of Beason till (R. F. D. No. 2) recently secured a patent on this salting device

Reliable Powers for Pennsylvania R. R. REMINDER BULLETIN

A Boon to the Busy Man

The use of the most modern type of speed-making locomotives, coupled up to the best type of equipment and guided by the most vigilant management makes railroad travel secure and prompt.

The time of a busy man is one of his assets. It means either gain or loss to him.

The certainty of figuring his time m transit to the exact hour reheves his engagement list from entanglement. The telephone may make the en-

gagement, the train will keep it. The Pennsylvania Special follows up the telephone message. It brings the two ends of the wire together and consummates the meeting between working hours.

The man with business connections in New York and Chicago can lose no time by traveling on the Pennsylvania Special. It runs while the desks are closed.

Pennsylvania Special (18 hours between New York and Chicago) leaves New York 3.55 p. m. Downtown Tube 4:05 p. m. and arrives Chicago 8 55 a. m.

Over five hours for business to 2.45 p. m. when it leaves Chacago for the East and arrives in New York next morning (Breakfast on the train) at 9:45 a. m.

Are You Getting A Dollar's Worth of Steam from Every Dollar's Worth of Coal?

Coal is but a means to an end, and that end is the running of a mill, a locomotive, a steamship, a dynamo. It is most important, because here the first loss so frequently creeps in.

Users of steam coal should purchase their fuel supply so that they are assured beforehand of a definite amount of steam-raising power.

PARDEE BITUMINOUS COAL

a high grade of Bituminous Coal for steam purposes, is all taken from the same basin in Cambria County, Pennsylvania. Its heat units are practically constant. The shipments run uniform—and just what PARDEE COAL will do under the boiler is known.

There's a dollar's worth of steam in every dollar's worth of PARDEE COAL. Ash and sulphur are at the minimum. That is why PARDEE COAL earns a premium for its high steaming qualities from large users.

That is why PARDEE COAL is the most economical. If you use but a dozen tons or many thousands per month, it will pay you to investigate. The services of our mechanical engineer or chemist are at your disposal without charse.

A TRIBUTE TO AMERICAN SHIPBUILDING

LTHOUGH the general public bas apparently falled to approviate the significance of the recent winning of a \$22,000 000 order for but ileships by an American shipbuilding competition with the leading yards of Great Britain, France Germany, and Italy, the Importance of this

France Germany, and (tally, the importance of this matter is fully appreciated abroad.

The facts are as follows. About one year ago the Argentine government asked for proposals for two first class baltiships, and it requested four American firms and all the leading for ign shiphulders to can arms and an internal manage for year as input in bids on the contract. The plans submitted were not accepted. The Argentine Commission then prepared its uwn specifications and asked hids from a selected number of these contractors. On the receipt of the second but of bids il again narrowed the comor the second let of plus il again narrowed the com-petition down to one American firm, the Fore River Company two English firms Vickers Sons & Maxim and the Armstrongs and one company each from Gr many, France, and Italy As a result of this lead com pelition the award was given to the Fore River Comp on designs and orice submitted by President Francis T m, formerly Chief Naval Constructor of the United States navy One of these ships will be built at the Fore River yard and the other by the New York Shiphuliding Company

dging from such particulars regarding the design Judging from such incliculars reparding the design of the vessels as are available, they still be the most powerful fighting ships affoat at the time of their sumch Although in displacement they will not exceed our two latest battleships the Wyoming and 'Arkan as the disposition of their twelve 21 inch guns is such that they still have a rounderably more powerful concentration of few ou every point of bearing accept This advantage is secured by placing the two amidship turrets in delicion ur diagonally, an arrang ment which permits the four guns in these turrets to end shead or dead natern as may be de sired Since the four 12 inch guns in the pair of turrets in the bow and at the stern can be trained axially, this ship will be capable out only of concentrating all twelve gins on either broadside as will be done by our rew'Woming (lass, but also (ight gine dead abese and eight dead asiern as against a fire of four ahead and four asiern for the Wyoming 'The beit is to be 10 tunnes in thickness and the speed 22 knots Apparently, unless some other features of the ship have been sacrificed this vessel represents the highest de relopment of offensive power yet attempted in the history of wacahip construction

That the Augustan tender was lower than that of auch firms as Vickers and Armstrong is explained by the fact that armor plate and the steel for the hull construction can be obtained at a lower price in the l'uited Sinics than it can alroad, the difference in this regard being so great as to more than offset the high cost of American labor. Whatever be the reason for our success, the fact remains that the plac-ing of this large contract with an American firm adds. greatly to the presilge of our yards and testifies to th high point of excellence to which warship construc-tion has been corried in this country. In this connec-tion we may as well draw attention to the fact that the apathy of the I nited States to any proposed meas ures for the respectation of our merchant marine has reduced the construction of merchant vessels to such a low point that our leading shiphuliding vards are a low point that our leading supplified yards are to-day kept silts almost sulfrely by gos rument orders for work. Nor must it be argued that the securing of this large warship contract proves that there is no necessity for government assistance in the uphuliding of our more hant marine, for the question of the sales ent cost of running a merchant ship, which is much

higher in the American than to foreign service, d not enter into the consideration of warship construction Moreover, the competition in the construction of merchant steamers is much keener and the prices are rela-tively lower than for the construction of warships

COULD THE BARTH COLLIDE WITH A COMET?

N May 18th next the earth will be plung into the tall of Halley's comet head of that body will be but 15,900,000 It is but natural that a think miles away it is but natural that a think-ing man should ask is there a possibility that tho carth may encounter a comet and thus come frightful and?

enough, it was Halley himself who first pointed out the possibliity Whiston Newton's successor in the Lorasian chair of mathematics at Cambridge was so starmed at "n charlot of fire' which flared up in his day, that Halley was prompted to look closely into its movements. His work led to the startling re into its movements. His work led to the startling result that the control, when passing through the deserred top node land suppresshed the earths path within a cuil diameter, of the earth. Saturally, Isality so nevel what would have happened had the earth and the count-been actually so clean together in their specific works. Assuming the count-to-mass to have been comparable with that of the earth tan assumption which we now know, to leave here siterify beyond reason) he concluded that their mutual gravitation would have caused a change in the position of the earth in its orbit, and consequently in the length of a year. This train of thought hed him to consider what the result of an actual collision would have been, and he concludes that if so large a body with so rapid a motion were to ririke the earth-a thing by no means impossible—the shock might reduce this beautiful world to its original

Hence liailey not only dispelled the supersti the terror which once followed in a comet s wake, but also pointed out a possibility which the superstitions Dark Ages had ever dreamed of the scened to Halley not improbable that the earth had at some remote chilquely had thanged the position of the axis of rotation, the north pole having originally, he thought, been at a point not far from Hudson e Bay The more recent investigations of Kelvin and Bir George Darwin Sime Halleys time the chance of a collision be

tween the earth and a cumet has engaged the attention of many astronomical mathematicians laplace, for example, painted the possibility of a collision with the carth so vividly that he startled his day and generation ite drew a phture of a comot whose mass was such that a tidal wave some 13 000 or 14,000 feet high inundated the world, with the result that only the higher peaks of the Himalayae and the Alps protruded Lalande created a panit by a similar consideration of the subject er which was intended for presentation before the Academy of Sciences, but which was not read the Asademy of sciences, and which was not read Such was the popular excitement, that he felt himself constrained to nilay the public fears as well as he could in a scothing article published in the Clasette de France The masses assumed by both Laplace and La

France 'ne masses assumed ny boni Japane ani ja-lande are so preposterona that their liberies are no ionger seriously considered by any same astronomer Since the day of Lapines and Lakinde there have been several comet "scares" Bielas comet crossed the varita orbit on October 29th 1832 When that fact was announced, Europe was In a ferment. The orbit of the carth was confused with the earth ltscif was the popular excitoment, that Arago took It upon himself to compute the possibilities of a collision He pointed out that the earth did not reach the exact spot where the comet had intersected the earth's orbit nntii a month inter, on November 30th, on which date the comet was 60,000 000 miles away incidentally he the comet was 60,000 000 miles away incidentally he pointed out that a collision was always happilly remote. He thought that the chances of a meeting were about one in 281 000,000 Babinet, on the other hand, thought that a collision was likely to take place once in about 15 000 000 years. More recently the au-tire problem has been considered by Prof W H Picker ing of Harvard By a collision he understands, first, that any part of the earth atrikes any part of the concts head, second, that any part of the earth atrikes the most condensed point in the head (the corel as distinguished from the larger nucleus. What the average size of n vis this comet's head may be, we have no age was of a visinise coincid nead may be, we have no means of knowing. Young estimates that for a telescopic come! If averages from 40 000 to 100,000 miles in diameter. The head of the great comet of 181 miles 1 200 000 miles, that of fiolime's comet in 1882, 700,000 miles, and that of naked-eye comets senorally over

In the isst half of the iast century 121 comets in cinding returns penetrated the sphere of the earth's orbit From this Prof Pickering infars that we should expect to be struck by the core of a visible comet once in about 40 000 000 years, and by some portion of the head once in 4000 000 years. Bince comets' orbits are more thickly distributed near the scliptic than in other

a of the aphare, the collini more frequently than this, but hardly as often as ones in 2,000,000 years, and since it has been estimated that animal life has existed upon the earth for about 100, 000,000 years, a considerable number of collisions, perout, our years, a considerant unmore or consistent, per haps as many as fifty, must have taken place durin that interval, in Prof Pickerings opinion, evident without producing any very sorious results. The old notions of the tidal effects of comets were

based upon an erroneous conception of comelary masses. It seems astonishing that a man of Laplace's masses. It seems automining that a man or respon-wonderful mathematical powers should not have con-cluded that a body like a comet, which can sweep through the entire solar system without deranging a one of its members, must have a mass so s that it cannot appreciably affect the waters of the earth. As it is, concess are more likely to be captured by planets (witness the comet families of Juniter and Saturn) than to derauge a member of the solar aye or to produce tidal effects

plunging of the earth in the tail of Hall of unturally causes many to wonder what will be the effect upon the tobabliants of the earth Similar passages occurred in 1819 and 1861 but no one was the planages occurred in [8]9 and [86] but no one was the where until long after 8 mom autonomers (alimed to have notived auroral glares and meteoric displays at the time, but whether these were really associated with the council or not annot definitely be stated. At with the council or not cannot definitely be stated At-all events, it may be safely held that on May 18th next-tone of us will be aware of the fact that we are literally breathing the tail of Halley's comet From this it may well be inferred that the wild taims of the possible reflects of poisonous gases, tales for which the news-papers are very largely responsible, are utierly without foundation it is true that a comet's tail is composed of poisonous and asphyxiating hydrocarbon vapors and or poisonous and sampyrining hydrocarbon vapors and of (yanogen, but it is also true that the actual amoust of toxic vapor is so small that when the earth is brushed by the tail of Hailey's comet, the composition of the atmosphere will not be so affected that a chemist could detect it Flammarion has drawn a vivid picture in his 'i.a Fin du lionde" of the possible effe passing through a tall highly charged with vapors. its death struggle with carbon monoxido gas, killed off with merciful swiftness by cyanogen and dancing joyously to an anæsthetic death, produced by the or sion of the atmosphere into nitrous oxide or destist's langhing gas." No one of any common sense should ed by these nightmares particularly when it is considered that so diaphanously thin is a come isil, that stars can be seen through it without dimb

PATRIT COMPLEXITIES IN GREAT BRITAIN

Y the course of a judgment in an important patient has before the liouse of Lords, the supremular irihund of Great Britain, the Lord Chancol for made wry judinted reforences to the complexity with which patient specifications modifies oncumbered During the past few years here has been as increasing tendency to render anche specifications as juricate and as voluminous as possible, thereby obsaving the vital issue. Only a few weeks previously the Chancellor complained in another action of the manner in which claim and narrative had been so intimately interwoven that con the had been so intimately interwiven that consider-shed difficulty was experienced in unraveling the real factors in the issue Such a tendency, the Lord Chan-cultor pointed out, defeated its own object, for whare patent specifications and claims were so framed as to puzzie a student, business miss were atraid to take out a license for its working, for fear their interpretaout a license for its working, for fear their interpreta-ltun of the patent might be found to be erronesens, be found guilty of infringement, and be mulcted in heavy demages. The particular case in which the Lord Chancellor was constrained to make these comments was in connection with improvements in the casting was in connection with improvements in the castring and trimming of stereotype plates. The court contended that the specification of the original patent was extremely voluminous and complicated, amounting aimout to the built of a treatise, in which there was infinite redundancy and reportitions, and constant references to illustrations which were conservable difficult to failure it was a document which needed a facility to failure it was a document which needed a possible of the content of the co lar field of industry might know how to avoid all pos

In the course of his remerks the Lord Chancellor In the course of his remarks the Lord Chancestor pointed out that inventors who drew up auch compli-rated claims must run the risk of the whole patents aboung declared void by the court on the place of an-higuity. The framing of specifications in this man-ne he declared to be an abuse of the law, and he gave the warning that it would be checked, if the occasion arose, by the simple process of declaring the patent invalid. These timely remarks have been patent invalid patent invalid These timely remarks have been creatly appreciated by British commercial and manu-facturing establishments, and there is no doubt that advantage will be taken to draw up specifications in a more concise and incid manner.

RAPID PROGRESS OF THE NEW YORK STATE BARGE CANAL

A RECORD OF RECENT ACHIEVEMENT

The large amount of work done on the New York State Barge Canal during the past year augurs well, not only for the completion of this great work within the contract time but for its being done within the estimate of total cost of \$101,000,000. Almost as much romatruction work was compitted during the

aggregate of the work under contract is \$14,18,729. It is satisfactory to know that this has been ascentially allowed as assign of \$2.570,200 were the estimate of 1903 for the same work. Construction work to twalse of more than \$16,000,000 has been done nearly one-balf of it during the year 1909, fiften and of the

According to Electrical Engineering a definite pro-posal has been put forward for the construction of a tunuel between Dennark and Sweders starting at Co-penhagen and consecting up with Malone Connec-tion would be made on the way with the small islands of Amager and Sathtolm and the electric trains which it is proposed to work through the tunuel would rus on the surface on these islands in order to reduce the underground (purary as much as possible. If the scheme is curried out it is cettimated that the traje could be made in 1½, howe

OSTRICH FARMING AS AN **INDUSTRY**

Does estrich farming pay? The question is asked by almost everyone who visits an estrich farm. The answer is that when an acre of alfalfa will furnish a for four birds with food enough to maintain lons for four birds with food enough to maintain them throughout the year when an outrich will yield annually about two pounds of feathers with an average value of 2d a pound and from hithy six to alterly eggs with may be used for Insubstion or may furnish food at the rate of seal for lone younds to the egg if the owner does not wish to Increase his troop outrich farming does pay and pays well.

There is nothing were juvable about an ostrich as there usually is about tober domesti azimats. But lowerer lacking in personal charm it may be the bix hill a non-yound producer. A level if may be the other than the part of the part of the pays of the pay

hird is a monty producer. A head of cattle eats sixty five pounds of alialat in a day an ceirful in no pounds. This head of cattle at five years old is worth \$10 and an ceirful at that age is wouth \$270. There is nothing to the cattle but meat. At ten months the ceirful will produce \$10 worth of feathers and therafter from \$28 to \$10 worth of feathers and manually for a long tended of seasons. you to sit were or restours annually to a long period of years. I hough an outrich is matured at the age of five and is reproducing its average life is about that of a human being. The bird does not be gin to decline until it is fifty years old. Many how

gm to decline until it is nry years out many how were produce fine i tumage at the age of a venty five There is as much difference in the breed of catriches as there is in any other animal Some of the Call formis and Arisons male birds are rated at as high as \$7 000 each but ordinarily the value averages ab \$400 for a one vear old 1 trd and about \$100 for a thick Some of the tooks weigh as much as foo pounds and stand over ten feet high

It has of late years been found that a great deal of It has of late years been found that a great deal of money can be made in outrich fearthing Especially so where affaifs or lucers as the raised on irrigated lands in the Sait River Valley in Arizons there are about 2 000 a ree of 11th land soon to be made riber and more, productive through immense that they made they made to the works on which the United States is spending too works on which the United States is spending too 000 50 km at climate is an feed one for outrich farming as the farms in that locality have airready proven by their successful operations. While the hirds theirs best in a warm dry climate they can be grown in any of the southern States and Territories of this country in a moist climate however they would have to be protected from cold and rain

It is only a little more than two decades ago since the first catri hes were brought into the United States ose of attempting their culti

here Before that time the only birds seek in this country had been adjuncts to divense. To-day at citative of those in soos there are stone four thosesaft hirds on the American continues. Probably half of the time to property of a single sair owned in the contract of the country of the coun

The female estrich matures much earlier than the cock beginning to lay fertile eggs when she is about three and a half years old. The next is nothing more or less than a hole scratched in the ground which is ne by the male bird At first the hen may not take to the nest but may lay her first eggs on the ground whereupon the male will roll them into the nest whereupon the male will redi them into the nest cleancily after the male has put three or four eggs into the nest the fermale will take to it. She will then lay an egg every other day until about sixtoss-eggs have appeared in the nest. An ceirch egg is nearly eight inches long and about six inches in di smeter II makes a good omselst and its arcellest when strainful Good one gew III make as much omselst as there doesn hem eggs A rull-grown bird has been known to produce over three hundred pounds of agg food in a year

food in a year. An annual increase of about fitty per cent of a food in severed mainly through the use of incubators, and the severed mainly through the use of incubators, and the severed mainly through the use of incubators, and the severed mainly through the severed mainly the An annual increase of about fifty per or oring the eggs at intervals during the night to prevent them from becoming childed. The birds are also very watchful in the warmest season to prevent the eggs from becoming superheated by the sun. The birds do this by resting on their ankle joints and spreading do this by resting on their ankle joints and spreading their wings umbrells wise over the nest As is assault; the case with all eggs in a dry climate the shell of an estrich egg becomes dry and hard. It is therefore very difficult for the chick to break through. When the time arrives for the liberation of the young they are board to chirp and to move in the shell, it played bird seems to badewined the situation, will often creds the shells with he breaddone, so will often creds the shells with he breaddone, so times taking the young by the bend and pulling it of the shell Sometimes from or five dryst edges tween the hatching of the first and the late egg. It into that the contract of the purely halds sitch in the a walls the other takes care of the chicks. However, a well registated out the farmer seation birds in hatching by executing the eggs with a ma humoner and putting the unlabeled eggs into at it.

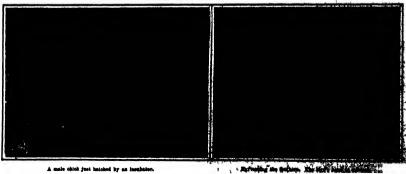

Dator

The chicks appear to be all ayes and necks when
they first come out of the shells yet their hodist are
as large as those of full-grown heat They are see
fussy and as soft as a day-old chicken but far more

fuscy and as soft as a day-old ohthen but far more steptif For the first week of their existance nothing but graval is given the young ostriches. Then thay are turned into small pean is the alinkin lots where they are to est slight for the rest of their lives. Picoling is the general term by which the harrest-ing of feathers is known. The term might lead one to believe that the feathers are pulled out. This is not the case however for that would injure the hind. not the case however for that would higher the hirt. The plumes are mipped off with shawr close to the Sash. The quills that are left soon die and drop out after which here whethere begin to sprout There are twenty five long white plumes on each wing of the cook blet The reat of the plumes is black on the male and of a grayish color on the femile. Gatherine the tacthers is no eary task. This work has to be signed with great care for a kick from one of the powerful less of the brief the snowigh to disable a man for life or even kill him contright.

or even kill him outright.
At the plucking time the birds are driven into indi-vidual plouking boxes and a loose bag slipped over their heads, which tends to keep them quist A cock bird will roar moorachily while being plucked al-though the operation is absolutely paties. After he has been stripped of his plussage he is about as mgty a sight as one could whold?

The first experiment of estrich farming in this country was made by an Englishman who imported his birds from Africa and paid as high as \$1 200 a pair for situa from Aricha and paid as high a \$1,000 a pair we them As it meanly every venture of this chargedor, the originator of the spheme did not make a fortune out of it. But the wise and daring havenow who hal-lowed in his footstops are new congretuinting them-solves. They are reaging the harvest his death dreamed of by the sparier of the injunery in that

to 3 246 106 cords of wood which furnished 2 118 947 tons of pulp. Nearly 136, million cords of domestic and over 670,000 cords of imported sprue were con sumed. Next in order is demestic hemick of which 69 137 cords were converted into pulp. More than 800 000 cords of poplar ways out last year mostly from domestic things. The remainder of the timber short 19 per cest, was chiefly supplied by pine cottonwood, and balanam.

THE HEAVENS IN MARCH

S the year advances, there is of cometary phenom ena which make the first half of 1910 so not worthy inness s court which was so inness a court which was so fine so edded at the end of Limitey, come almost to red among the stars early in Phrinty moving alm

straight away from the curti and rapidly losing bright ness. By this time it is unobservable, behind the sun and some distance nurse in the celliptic. In another mounts or so it should be seen in the morning sky, but

only with telescopic aid

The determination of its orbit has apparently presented nuusual difficulties, in order to calculate a comet's orbit, we must first have accurate observations in order to calculate a Such observations are usually made by of its position. Such absorvations are usually made by measuring with the telescape the distance and direction of the conset (or equivalent quantilles) from some size whose data the has by a known from protons observations taking care to note the time at which these measures were made. In the present case the count was at first chibits only in daylight, when no suitable. Your

parison stars' could be seen its position in the sky had therefore to be found by means of the endings of the graduated circles attached to the tele scope, and these are far inferior in accuracy to measures of the former

Il is not therefore sur prising that the prolimi mary orbits calculated from these rough observathemselves When the morping sky, and can be accurately observed, the comparison of the results with the few accurate observations made in ianu ary and February will set the the question

Halloys comet is also out of sight for the pres -behind the sun nearly so and about 176 million miles away may still be observed telo ically low in the west in the early evening for a few days early in the month, but it cannot be seen in the morning sky until April is well begun, when it will reappear, ably for brighter n it vanished in the twillght

We must therefore for the time being hern our attention mainly to the stars, and among them we will find much to occupy us while we wait for the

Let us begin right overhead with the constellation Gemini its two principal stars Cas-tor and Poliux, identify it at once, for nowhere in our skies are two equally bright stars as near neighbors The roughly parallel lines of stars which run south west from these and terminate in the stars \u03c3 and \u03c3 castor itself is a fine object with even a small tele-

scope, showing double with a power of fifty diame The two components, one about twice as bright as the other revolve about one another with a period of perhaps 400 years. The faint star which lies about twolve times as far from them as they are from one another is moving with them among the other stars, and is is mustice with them among the other stars, and is unrobably alse in very slow revolution about them but, if so must link more than ten thousand years to complete on landy clear! This star 2 is also a fine double Close by to the centward in Cancer, with no bright stars but one luter-suitsy cluster, within clearly to the maked ove, and resolved into its separate stars. This spot of links known as Traceopp by a field glass. This spot of links known as Traceopp (the Bechive), is marked on the map Auriga, which ites in the Milky Way, northwest of

the zenlih, is one of the finest consicilations in the sky The figure of the charloteer knewling in his charlot forms our initial letter The most northerly

bright star of the constellation, δ, is in his head, β is in his right arm, and the brilliant yellow star ('aprella (a) marks the Gost which he is supposed to hold in his left arm, while the three smaller stars just below it are called the kids—an armful indeed.' just below it are called the kids—an armful indeed: Farther south \(\theta\) is in his right knee, and \(\text{c}\) in his left foot, uncomfortably near the tip of one of the ltulis horns (\(\theta\) Tauril

Canella is next to Siring the brightest star in the part of the skies which we can see-secording to the data of the Nautical Almanac Arcturus and Vega are however very nearly its equal in hrightness, and the three stars differ so widely in order that different ob servers, whose eyes were unequally sensitive to light of different colors, might easily disagree as to their relative rank Well down in the west are Orion and his neighbors, Canis Major on the left and Taurus on his neighbors, Canis Major on the left and Taurus on the right Mare passes through the latter consisies tion during the month, and fairly rivals Aldebaran in color and hrightness Persous and Andromoda are in the northwest—the latter partly set—and Cassiopela farther to the left

Farther to the left.

Due south we see Procyon, with the few faint ablendants which are supposed to resemble the Little
Dog, light up near the meridian, and part of the great
constellation Argo low on the horizon Farthor east,

right of the pole, Ursa Minor, inclease within the aweep; and Cophens, low in the north, complete our

Mercury is morning side gill through March, but, being south of the sun, is not well observable in those latitudes. He may perhaps be seen early in the month, but only with difficulty, as he rises but three-quarters of an hour before the sun.

Venus is likewise a morning star, and, unlike Mer

cury, is very const

cury, is very conspissions.

Ble reaches her greatest brightness on the 18th. At this time she appears, with a magnifying power of fity diameters, just as the crescent mone some five days old does to the naked eye, except that her arrive is free from perceptible markings, and naifornily white. Ble riese about 4 A M and is the principal ornament of the morning sky indeed, there is no difficulty about seeing her in broad daylight—if the sky is raily clear—except that of knowing where to keep a state of the sky is raily clear—except that of knowing where to cent mone will be a good guide, as Venus will lie shoult she or six degrees pearer the sun, and shows about five or six degrees nearer the sun, and about two degrees above the line joining them

Mars is still an evening star, but is steadily losins

This took the piage of the normal rife action, the lass of fire remaining the same year in and year out.

Fig. 5.—Riements of the o shows in Fig 2.

Task the extens of upper inft sorror where a true bullet points to numbers I and I bullet holes is 614 inches and is 160 yeards. The errors investe as distances from the manule show that No. 3 shot had no Z way. A like we have absent that so to Ea. 1 bad no Z acros. This liberartion shows the error resulting from a tipping

Fig. 6.-Y-error of 190 yes "Learneed by actual target made by two unbelanced builden.
225 Markov Plants - 6863 MEN'S BROWNERD REBORS IN VARIET SECONDS.

testing some of the curves which the build made, but in many experiments it was found necessary to place the screens from six to three inches apart to register

> and of several years the author could so place any desired infor mation respect ing the bullet's motions could be expeditionally ob-tained, one irregularity after another being eliminated to that end

As is often case in all scien preconcaived ideas of the bul lot's action proved to be more or less incorrect. and he stronges fixed idea of all.

the one to which it seemed all conclusions must be made to bend, was found to be absolutely incorror. This idea, that the butlet during its passage through This idea, that the builet during its passage through the rife must and did fly in a straight line with the bor, and that afterward it changed list effection to fly away from the mark, held the author back from the real fact for years. Streems placed at one two, or three foet from the muzile showed indisputably that an unbalanced builet left the line of fire, or line of the bore, immediately upon its exit therefrom, and the cause of this was a very astounding discovery to make

tause of this was a very astouding discovery to make it is easily understood that the center of gravity of an unbalanced builet is not in its center of form, and therefore not in center of the riflo bore. Due to the twist in all undern rifles, this unbalanced builet rotates during its passage to the musrle and carries its center of gravity in a spiral around the straight line forming the center of the bore, and also carries into forming the center of the bore, and also carries its center of gravity around the center of form of the builted itself in mechanics and especially in ballis-tics the course through which a hody moves is the tion the course through which a nody moves is the lime in which like center of gravity travels Hence the unbalanced buildt fall bullets being more or less un balanced) travels in a spiral through the straight rified lower, compelled to take this spiral course, by the solid walls formed by the internal surface of the barrel

When the projectile is liberated at the muzzle, no inger forced to make a spiral flight, it immediately takes up a straight flight, which it must do according takes up a straight sight, which it must do according to the fixed laws of inertia. This straight line, however is a conlinuation of the flight which the bullet was insaking as it left the muzzle not the line of bors, but a tangent to the aptral which the projectife dearthed in the bore as represented though groundy as agreemed, by the spiral was and its tangent to or r in

Fig 3 evaggerates and makes clear how the center Fig. 3 evagperates and makes clear how the center of gravity of an unbalanced bulle move in a spiral form within the bore, but how who illbrated at the mustic, it takes a straight illight, as represented by the tangent at the right extremity of the spiral in the direction of a No possible power at the muss' could make it take the direction of bore as represented by add, without distinctpraints the bailet, based of flying straight in the rifle force as every one supposed, and making some, change in the direction afterward, in resulty files in a spiral during its parallel for the contraction of the contraction of the spiral during its page to the muzic, and does not sage to the muzic, and does not

y nies in a spiral during its just-sage to the muzele, and does not change its direction at the muzele, because there is nothing there so to change it. This is the long-searched for cause of error at the target

The presence of this error, called the "Y error" by the aucalled the "T error" by the au-thor, was clearly demonstrated in screen shooting by E A Leopoid of Norristown, Pa a number of years ago, and the apparent change of direction in the flight of a buildet at the muxit was known in an indefinite manner to various rifement. Their altempts to overcome it, and the theory upon which these altempts was (Continued on page 216.)

TOOL-HOLDING DEVICE FOR WOOD TURNING

BL I HALBORY W NIPHAR

House who me a wood lathe find frequent occasion to make special tools for difficult or unusual work, and when the tool is so shaped that the cutting edge is at right angles to the shank, great annoyance is apportenced in holding the tool to the work, and keeping it from turning in the hand Recently I had

TOOL-HOLDING DEVICE FOR WOOD TURNING

a piece of work similar to that shown in the drawing and after many expedients had falled to give complete ratisfaction i developed the device illustrated. It is reade of heavy sheet stori (the heaviest i could work easily) and provided with two saturcess, as shown, to siles it to be moved along the chiesi as desired, and for the insertion of new chisels. As illustrated, the flat portion lies on the tool rest, and this abs lutely prevents the turning of the tool lutely prevents the turning of the tool. By its use I was able to reach with ease the most inaccessible

ELECTRIC INCURATORS AND BROODERS.

The nilvantages of an electrically heated incubator over these making use of kerosame lamps and the like are so great, that as rupidly as cheap reliable power service becomes extended throughout the country, the liatching of ogen by obstrictly bids fair to displace all

An electric incubator can be built at home by any-

An electric incubator can be built at home by any-body who cast make a wooden box and connect up the cast make a wooden box and connect up and the cast make a wooden box and connect up the cast make a wooden box and continued to having nothing about the law on, and or being couplies of giving perfort creating one, and or being capable of giving perfort creating who will be the photographic about the present The photographs above the first incubator built to the author, while the drawings give details of con-struction drawn to excle, for a similar machine of fifty exex capacity. Directly it consists of an outer and an inner wooden box, having the space between them pasked with wood or other heat relaining ma-terial The eggs are placed in the inner box, which is waited with incandescent lamps controlled by a iterriticati

The loxes should be made of well-seasoned lumber about 's inch thick. Old soap boxes furnish good material for the

For a purpose rolling the luner box needs to be it inches wide, 17 inches long, and 11 Inches deep, all inside meas crements. This box is to be left without any or bottom (keept a statted bottor which is to be put in half way down

thus dividing the lox into an upper and a lower compartment of equal depth. On top of the slats a double thickness of woolen blanket should be tacked, to support the eggs, as shown in Fig 1

Eight cleatric lamps are required for the heating units. These are best mounted in porcelain recep-tacles as shown, four lamps in each compartment near its ion For 110-voli circuits use ordinary 16-can die-power earbon filatuent lamps made for 230 volts. and connect them as shown in the diagram, where REG means regulator, or thermostat and RE are snap switches to be placed on the outside, as shown in one

Scientific American

It is hardly worth while to make a thermostat at bome when one suitable for the purpose can be benefit. From a dealer in electrical supplies for about service, from a class in electrical supplies for about service, the control of the service of the service of the service. It is taken pleasure in defing such word: Fig. 2 shows a lastice of the seg chamber. The essential part consists inside of the seg chamber. The essential part consists of two strips or metal riveted together as shown in the top view at A. Zinc and stor! (or iron) makes the onest effective combination, brans and steel (or iron) come next. The strips should be about 1/33 insh like, A linehs tong, 1 inch wide at the large sed come next. The strips should be about 1/32 inch shick, it inches long, I inch wide at the large and and 2/3 inch at the narrow end Thou may be fast and 2/3 inch at the narrow end Thou may be fast by siderint the large and and 2/3 inch at the narrow end Thou may be fast by siderint the large and the large. The two instals thus joined tend to curl and uncurl with changes in longerature, by reason of their different rates of expansion. The large and should be clamped to a brinck, B. as abown, and a counted from the outside to reverte for adjustment from the outside to reverte for adjustment from the outside the spot on the nine for the shorting are which appears between them will soon destroy them the spot of the shorting the

top by three or four half inch tubes for ventilation as shown at V, Fig 2 The top of the egg chamber is best covered over

with a pane of glass, on top of which is laid a small pillow or several thicknesses of folded blanket. Next in importance to the thermostat comes the choice of a thermometer and its proper location in

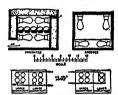

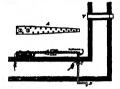

Fig 1.—CONSTRUCTIONAL DETAILS AND WIRING DIAGRAM OF THE INCURATOR AND BROODER.

the egg chamber, where the bulh should occupy a central position rather than one near a corner it is not necessary to buy an expensive instrument in order to get accuracy, an ordinary teneent thermometer can be made to serve the purpose very well provided that its scale be properly corrected or 'calibrated' This and scale so properly corrected or 'calibrated' This may be easily accomplished by taking advantage of the fact that the internal temperature of a normal, the takethy person is just a trifle over 98 deg Tie, a thread around the tube at the place marked 95 deg on the scale, and remove the tube from the scale, but the scale, and remove the tube from the scale.

eight lamps in use, the apparatus as described is capable of maininining a temperature of 164 deg. in the egg champer when the room temperature is only 40 deg. If used in a warmer room, one pair of the lamps in the lower compartment may be turned of

Marin & 1919

by means of the amp switch
Each pair of \$20-volt 15-candle-power on Ench pair of \$50-roit 15-canda-power carbon hamps, connected in series as shown, will, when used on a 155-roit circuit, burn with a dull red glow searcely registle in daylight, and with a power consumption of 54, in daylight, and with a power consumption of 54, the temperature is \$4 day, common an occupation of the temperature is \$4 day, common an occupation of making a total for 35 days of about \$1 kinevant hours, which, where the rate is 10 cents, costs 50 cents. This cost isots high at first sight, but it is materially lower than that of a horesen-burning machine if one stops than that of a horesen-burning machine if one stops are acting in the contraction of the investment,

Pig 1.-METHOD OF APPLYING THE THREWOUTAY.

the saving in oil, the absence of depreciation and pair hills, and the saving in labor of atte In the practical operation of the incubator, the fol-lowing points should be borne in mind

The eggs need to be turned partly over every day A cod way to do this is to take out the row of five eggs

good way to do this is to take out the row of five eggs at the left hand, and, roll the remaining ones toward the left, and replace the five at the right-hand end. This progressive movement serves also to even the different times of hatching that might result from come eggs remaining in warmer good than other face once eggs remaining in warmer good than other face remaining ventilation is required an incubation progresses. Practically no air is needed the first progresses Practically no air is needed the first over vents, and all ventilating tubes and the door to the lower compartment may be kept closed with considerable economy in power. During the third week, and competally when the hatch is due, plenty of air must be allowed to filter up through the eggs, as shown by the arrows in Fig. 1.

to allowed to filter up through the eggs, as shown by the arrows in Fig 1 No moisture is required during the first week Therester it is best to keep a small pan of water in the lower compariment and a small glassful in the ogg chamber These serve to prevent eggessive evap-

cration of the eggs by too dry air
The newly hatched chicks should not be taken out
or fed until they are 24 hours old After this they may be kept in the lower compartment for a time, provided all four lamps be kept burning. As soon as conveniont, however, they should be transferred to an electric brooder, two forms of which will now be de-

scribed
The first and simpler form, suitable for use only in
a well warmed room, is shown in one of the phone
araphs. It consists of a small wooden table carging
on its under sides four lamps, and surrounded by a
fringe made by slitting a piece of db hanket. Per
use on the ground or where the foor is not warm, bottom best must be provided as shown in Fig. 17 when
chicks can be secon mond a sed.

commodated by such a brooder baving the follow-ing dimensions Top, 14 by \$6 inches, supported by legs 8 inches long. Bottom box of wood, 16 by 20 inches outside, 3 inches deep inside. Box-cover of tin 14 by 20 inches, protected on top by a sheet of

sprinkling of mad Four lamps are required in the upper part, one near such corner, and two in the bottom heater it will be observed in the diagram of connections that the latter lamps are connected in parallel and not in sortes which compete connected in parallel and not in series, which them to hurn more brightly. The pewer commu-is 33 watts, or about twice what is required for ing. No thermostatior thermometer is needed; if brooder. It will not get too warm if the cur-

brooms at win new me too waters as you make it in the first on all the times.

Lumber, etc	95
Total	

The foregoing bill does not include the shaded lawn and fixtures shown on the outside of the incubator in Figs. 1 and 3 An ordinary 4-candle-power lamp so is a convenience, but not in any way ease

CONVENIENT DOOR MOLDER.

A convenient door holder may be made from a barrel hoop, as shown in the accompanying illustra-tions, by cutting a piece about oight inches long and inserting a rubber-head tack (such as used in the inserting a rubber-head tack (such as used in the plumbing trade in such and, on the under side, as abown in Fig. 3. Two such tacks are also placed on paper face, speed apart antificiently to allow the bottom of the door to fit between them. The arched shape of the hoop will give sufficient friction between the door and floor to hold the door in any desired position. If rubber-head tacks are not available the node may be covered with some soft material such as carpet and tacked thereto. In place of tacks, a notch may be cut in the barral hoop squal to the thickness of the floor, as abown in Fig. 4 or the Illustration. The

center of a barrel stave may be used instead of a hoop by cutting it to about the same width as the hoop

BORING MOLES IN GLASS. Man 1 Mg

Giam is universally conceded to be exceedingly diffi

Giass is universally conceded to be corcedizely diffi-cult to work when cold, yet its fragile nature often calls for means of repair. It is also desirable contents to drill ingre holes in giass plate, or through a large plate of the content of the content of the content of any facilities hitherto developed for such work. It is well known that turpenties applied to a small drill will enable one to drill through a piece of giass by paradests application and frequent grindings of the drill. This hole will often taper from a larger dismeter at he top to a small or one of the bottom, the drill. This hole will often taper from a larger diameter at the top to a smaller one at the bottom, and busides it is quite impossible to drill rave bottom, and busides it is quite impossible to drill restrained work of certain classes would be made bottom also if it were of certain classes would be made bottom also if it were of certain classes would be made bottom also if it were or other parts are composed. In the opinion of the written be set fluid to be applied to the glasse so that the tool will take hold is that of the formular given below. It has been developed after many superiments with different mixtures, and will 10 found to be su perfor to anything beweighted from your with a betavel fit, we will hill, a place of plain glass many be not into fax used. But where there is much glass to remove, the congret the fit the bestor.

For ignificantly much joine, a bream tube of the classified of the about visible is breather than a drill. The hole glassified is called more of it the with that is do come in quinter with the flower of the classified of the about the flow of the classified of the best visible is breather than a drill. The hole glassified is the flower of the wind that is do come in quinter with the flower of the control of th

made in the side of the tube by filing into it with a round file, and it may be turned either by a drill press or by one of the small, geared, hand drall-stocks used for small drills. With a small break disped into the solution as herein given wipe the hole s and onto the mixture with run down inside the tube, and onto the glass where the hole is being made, and the tube will be found to enter the glass with sur-

rising ease.

If it is desired to have the edge of the hole sharp
here the tube comes through, cement a small plece of

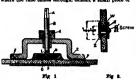

Fig. 1 -- APPARATUS FOR BORISO LARGE HOLES IN GLAM. Fig 8 -METEOD OF REPAIRING GRACEED PLATE GLAM.

giass to the under side of the plate being bored, and when the tube is through, continue the boring until it has entered the lower plate slightly Glass cut with the diamond will often break unevenly, and fall to fit a window sash, circles cut out for the dists of instru-ments of the clock class, circles for static electric maments of the clock class, circles for static electric mis-chines, giaser overse for galvanouters, ammedyn, and many other instruments are offen thrown away, when a touch with a file wet with this solution would save them. It is especially recommended to glasters to re-move the sharp odges of the giase cut with the dia-mond, which often cut the hands. For boring large holes in plate fixes the fig shows in the sectional view,

holes in plato grass the lig show Fig 1, is very handy, in fact aimost essential if correct re-sults are required. It can be easily modified to hold the cutter for boring circular work, ter for boring circular work, such as glass columns or con-cave surfaces, where circum-stances require such variation. The frame is an iron casting having feet J. and is bored out to receive a steel hushing C, which may be hardoned after a central hole is made to receive the shank B of the outreceive the shank R of the cut-ter bar The top of the cutter bar or shaft is squared at A so that a hit stock may hold it, or it may be held by the chuck of it may be held by the chuck of a drill press. The bottom has a flange and a pilot L, which fits in the hole of a small cemery wheel G of the kind used by toolmakers on univer-sal grinding machines for lapping out smell holes.

The lead bushing in the wheel

should be cut out on the side that is to do the boring, and the pilot L must not go entirely through the wheel, but be

pilot L must not go entirely through the wheel, but be out at least K, of an inch short of the wheel thickness. The wheel may now be comented to the cutter shift it be setting it, and sho the wheel slightly, so as to melt seems gut m shellar. which has been syrinked out low low the state of the shift of the shift of the shift of the old liquid gious and enery of about the same grade as the wheel, and fill the bottom of the look P www with the wheel In diright will shirt all sightly and the patter may be applied again, and until the surface is flush with the side of the wheel.

feet J of the frame have thin rubber F (k)

The rest J of the frame have this rather F (known in the strons as "rather dam") connected to their under after with bievels lire censons, so that when placed on the giass the jig will not allo around, but can be easily hold in any desired location. The place where the boils is to be made having been saccetained, a ring of puty D is stack to the glass to form a cup, and after the wheel shaft is insected to the bushing, the apparatus is placed with the face of the wheel over the spot to be bored, with the face of resting on the glass. Before beginning operations a place of double-thick window (also if is considered with French copal variath to the under side of the plate to be bored.

THE PERSONAL PROPERTY.

(Continued from page 198.) heretofore, several of its small steel is, but the construction novelty of the ras a buil built of phon show was a hull built of phosphor-bronse plates riveted together and attached to the ribs by means of U-shaped clamps passing over the latter and riveted to the hull. free boats were constructed by the Davit & Do Groot Company, a firm which has had a great deal of experience building riveted steel-hull lifeboats for the United States government. The phosphor-bronne hull has a great advantage proor-rouse BUIL DAM & greek SAVENINGS over the steel shill on account of the non-correstre qualities, and in addition to correstre qualities, and in addition to receive through the rith. In B. 38-foot, and the same state of the same cancern, the was the same cancern, there was installed a new type of hydraulies steering grear, which consists of two served cylinders with movable plungers placed at the tearing wheel and consected by means of small copper justings for The cylinders and tubing as a fined for The cylinders and tubing as a fined for The cylinders and tubing as a fined with the same state of the transmitting pitches at the steering wheel being sufficient to actuate the rudder positively. The mitters used is non freezing, so that cold weather does not affect it. This steering gave a decided inover the steel hull on account of its non steering gear appears to be a decided im provement over the usual form, since it is

easily worked and is more or leas selflocking. Probably the most popular craft schliized were the open speed beats, which

Caisada
The motor best industry, as mirrored by the 1916 show, is increasing by leaps and bounds. Aiready there are \$6,000 motor bests in use in this country, and it is sate to say that by the ond of another year this figure will be materially

THE FIRST ALEMENTAL REMOVALITIES SHOW AT BOSTON

The two general views of the Boston aeronautic show reproduced herewith will give our readers a good idea of how weil-filled was the large hall at Mechanics Building with the machines of American inventors at the recent show While a the lines of some of the successful Eu-pean models, most of them were pattern pean models, most of them were patterned after American models, such as the Cur-tiss and Wright biplanes and the Pfitmer monoplane In one of our litustrations a monoplane on the general lines of the Bleriot (the "Morok") with the silding Hieriot (the "Morok") with the sitting wing tipe invented by Pfitzner instead of wing warping, appears, in the foreground, while the large Antoinette type with triangular body and the smaller Ble angular body and the smaller Hieriot type monoplane were both axhibited by the Scientific Aeroplane and Airship Com-pany of New York Both of these ma-chines were constructed by Stanley Y.

Beach
Another general view of the hall shows
the former of these two monoplanes in
the foreground Another monoplane of
original construction (the "Burlingame") original construction (the "Burtingame") appears in the citize, while hanging from the ceiling is a hiplane gitder constructed and used by the students at Boston "Tesh," and just below this another gitder built by two boys after a description built by two boys after a description of the Arc Citis of N. S. is seen partially inflated in the center of the hall, while on the right-hand side are seen several balloon baskets, among them being that of Los Berren's small one-man of the hall of the control of the hall of the center of the center of the hall of the ce

carrying 20 passengers.

The l. A W hiplane and revolving The l. A W biplane and revolving cylinder 2-cycle motor was one of the novelties of the show. This biplane was constructed somewhat on monoplane lines, there being a rectangular body extending out behind and carrying the biplane horrisontal rudder for steering up and down. The motor was mousted on truminons close in front of the mean targets where close in front of the main pianes, which mounting makes it possible to direct the propeller upward slightly when the machine is running along the ground in order to rise. The new revolving-cylinder motor used on this machine is said to be one of the lightest motors of this type yet produced It is soon to be put on the market in two sizes of 50 and 100 horse-

Bestides the seruplanes shown in our photographs, there were numerous other full-ties machines. Most of these word described in our last issue. A Farman machine like that used by Farman at Printon Beston in 1100 was put on exhibition when the show was half over This machine was the only aeroplane said to have made a short flight previous to the opening of the show

THE UNIALABORD BULLEY.

THE VERGLERY DEPARTMENT STATES, (COnsistence from page 201) based, indicated plainly that the cause, so simple actor discovery, was not own surmised. Their attempts to reduce it were based upon the theory that the blast of powder gases at the musside, are some condition of the rifes hore at the musside, are accountable of the property of the areas. some condition of the pitch burs at the mussic, was responsible for this appear at modes change in direction of the ballet's flight at this plane. Persistant sevens shareling and contin-ued climination of errors that were (Concluded in page \$4.5.)

田里

(Concluded from page 210) en, indicated clearly that error was not the only error Another chase was at work which added to or subtracted from the X error, and while nting for this the author desig mated it the "Y error."

sated it the "Y error."

He had known for years that tipping bailete make a spiral flight as they pass through the air E A. Leopold determined the dismeter of some of these spirals several years ago. It was generally believed that a builet often makes a spiral flight over the rauge, and the cause. rai flight over the range, and the cause of this Y error at the target seemed to have some connection with this spiral in the air, which nearly all unbalanced builets describe. The author's own screen shooting exhibited clearly the diameter of many of these apirals and the distance or many or these apirals and the distance from the muzzle at which the spirals commenced. He found the cause of the Terror to be as simple as the cause of the I error

The X error spiral ends at the musale, hile the Y error, in the air, commences The X error spiral ends at the muszle, while the Y error, in the air, commences about 12 feet from the muszle. The bul-let makes an apparent change in its di-rection when it leades its X spiral at the rection when it leaves its X spirral at the musais, and it makes another change in its direction when it goes into its Y spi-aid. The resistance of the air upon a tipping builet produces its air spiral, and the rigid wails of the ride barrel pro-duce the X spiral described by an un-bianced builet in the bore The pitch of the X spiral, or the distance of one outra of the spiral to the next, is the same as the ride twist which for a 0.32 cullber is about 12 inches The pitch of caliber is about 12 inches The pitch of the Y or air spiral is about 46 feet

the f or air spiral is about 46 feet.

The diameter of the bore spiral varies from a fraction of a lhousandth of an inch to several thousandths of an inch. The dismeter of the air spiral varie from a few thousandths of an inch to 7/16 of an inch, depending upon the amount the builet tips in its flight. The

amount the bullet tips in its slight The air spiral, or course, results from the fact that the tipping bullet does not point in the direction of the slight The causes of these two errors, X and T, are the same in principle, but their positions are reversed. The workings and explanations by actual experiments, wall illustrated, are set forth very eaborately by the authorized and the set of the very eaborately by the authorized and the set of the very eaborately by the authorized and the set of the very eaborately by the authorized and the set of the very eaborately by the suited.

The following onclusions may be drawn from the bok

drawn from the bok in careful weik argst work, under favorable shooting conditions, the X+Y orror at the 100 or 200-yard targst is about 80 per cent of all errors. The y and Y results from the fact that the tangint of a spiral $(c\cdot)$ forms an angle with the axis of its spiral $(d\cdot)$, as may be seen in Fig 3. The builet as a whole makes a spiral fight while in the rifle, because it is unbalanced or because it is unbalanced or because it. does not lie central and straight with the bore It makes a spiral in the air be-cause it is a tipping bullet. It is a tip-ping builet because it was unbalanced when it left the mussic. The unbalanced ween it set that mussic. The unbalanced hullet, with respect to the center of the sife bore, is therefore the prime cause of its X and Y errors.

rent in the rifle and its ammunition, the rent in the rife and its ammanilion, the huitat, before being shot, must be a bal-anced one, that is, its center of gravily must ceincide with its center of form. The powder charge must produce uniform pressure from abot to shot. The rife, harrel and ammunition must be so con-structed that the projectile remains bal-anced throughout the entire bore

To have a projectile start from the mussle in the right direction, that is, in mussic in the right direction, that is, in the line which forms the center of the bore, the entire builet just as it teaves the mustle must be symmetrically bal-anced around the line of fire Apy rea-sonable rifleman would admit this last gatement. What the author's work has disclosed, however, is to point out clearly the fact and its importance, and to show the net and its importance, and to show mathematically that practically the whole error at target attributable to the mod-er's rifle and its ammunition originates in the unbalanced projectie.

THE "WHIP-CREATION' BATTLESHIP

tile Washington correspondent who is re-sponsible for the distribution of payal and military news to the stally press of the country has been writing some extremely sitly monstens, about the two battleships which the House Naval Committee has recommended for this years programme, and he has put into the month of been tarry Meyer statements as to the objects which have insolved the request for these two powerful was have inspired the request for these two powerful was sets which we are perfectly satisfied the Secretary could make him to the roll According to the dispatches the motive responsible for their impresedented size, reported to be from 8,000 to 3,000 tons, is the reported to be from \$0,000 to \$2,000 tons, be the desire to built a couple of ships which shall be blacer than nurthing else utloat and give to this matten the prestige of proceeding battledding which in respect of size and terror producing qualities about be supremely of the white continu' order

It is sufficient to say one and for all that the day of while-cention sentiment has long ago possed -if limbed it ever existed except on the street or in the If third if ever exhibit except on the street or in the muscle full balled. Certainly, it was never motive in the optautiding of the Inited States may. Our frig-alise of the sulling days were built swifter and at acad stronger than the ships then afford in other masks not for the variagions of being take to say that they were swifter and more heavily armed but for the very practical purpose of overtaking the enemy bring ing blue to action and crossing blue to superior gun The polley of that carry time has been the polley of our mass in the intersening one handred years at lt is its patiev to-day if Secretary Meyer believes it to is expedient to build a ship many thousand lone larger than anything contemplated abroad we may rest assured that it is because he and his naval ad viscus is they that to anniutation our traditional an performs in gon fire we must move up from the 12-linch to the Himch gon and increase our dispincements in proportion

most efficient bartleship is the one which bodies the maximum amount of all round nellitary of ficiency on the minimum amount of displaces. Unless the present theories of naval designers much of fautt, a ton of displacement in n big battleship gives more military value than it does in battlishing given more millitary value than it does in a help of smaller raise? Thus 2000 tons in a Delawarr is a more valuable most than the same displacement in two 'Uresons'. Here then is another cause of Rel'apuld growth in revent vars in the tennage of the first-loss flighting ship. From the 12 500-ton 'Maline' out ablies of the first line have grown in brough the 14,000 tons of the "One-thirt, the 20 1000 tons of the "One-thirt is the 25 000 tons of the "One-thirt is Arkansas and Wyoming' which are now upon

the sireba
The big jump of 2' per cent in displacement between the "Connectius" and North Daktota" was due to the counting of the diseasement between the the connection of an ext insiste unital arinament of 12 facts guaranteed on the connection of an ext insiste unital arinament of 12 facts guaranteed on the connection of the sister of the connection o and power of the observer tent claim by the substitution of the 14 link for the 12 link gun. The House Committee on Naval Affairs has accepted we are glad to see the Secretary programme for increasing the force of the navy by two battleships two fleet colliers. one repair ably and four submarines of a new lype of unusual speed and steaming radius. According to the provisions, the ballieships are to be of at least 26. tons and each ship is to carry len 14 inch guns, the

ships being made of sufficient displacement to carry this battery. The 14 linch gun, however, with its mount ammunition, etc., is so much heavier than the 12 linch that the new vessels even though they carry twelve such guns, will have to be of at least 28 000 tons displacement, and if it should be decided to mount twelve such guns, the displacement may run up to

is where such guns, the displacement may run up to 400 tons and over Because of the greater punishing power of the 14 lach gun at long ranges, a battery of ten 14 lach would greatly outmatch one of twelve 12 then 1 here is no ship affont or contemplated so far as we know, among the navies of the

HIGH-APRED PRIRORAPHY.

HIGH-SPRIT PELEBRAPH.

SIME very remarkable testimony has been efficied by the Joint Committee of the Legislature which is investigating the question of extending the jurisdiction of the Public Service Commission to and over telephone and telephone prompanies. It for runarizable as seculing to indicate that in side of the targe amount of thought, and mechanical skill which have been discussed in the commission of the service and the service a gausty, and mechanical skill which have been di-rected with marked success during the past few de-sades to the improvement of the speed and lowering of the coat of referrably prescribally the whole to the business of the bit telegraph companies is to-day sent by the hand-spearted Morne key, in much the same way and at no greater speed, than when Morne first was a supported to the same of the same of the most referrably as marked commercial art. The according to the testimoty of Col. Clovery, president-mission is obtained in their service by two systems, the Wheatstone and the Barclay the former having a capacity of 125 words per minute, and the latter of 90, will an average of about 50 in gractical use, would se and these two forms of apparatus, it

and those two forms of appearatis, it would seem, represent the only departure maile by the Western Union Company from their almost universal practice of operating by hand by the Morose key.

Bide by side with this evidence testimony was atten that rapid telegraphy systems have been developed here and in Europe with capacities of from title 10 several end over one system, stabilished in several coulers in the United States to great the several coulers in the United States to great the several coulers in the United States and the several coulers are several to the system of the several countries why do not the take graph consenses make use of the system companion of the several countries. In this testimony tells only explained that the Western I united is not reverse beginning and that the company cannot hold message multi they get a sufficient number to send messages multipley seed a summer conductor to assert as in 1000 world on hunter and this is true as regards the single-short message but in the case of the longer message approaching the manuscript belief length; the type of bushins which would be certain of enormous developing if it were offered to the public throughout the whole twenty four hours of the day of the low rules which would then be assulble Its day at the tax rains white would then be possible —
It would be previously in purching the scaling tages
and the message could be sent through in less than
one tents the time that it would take by the gresent methods The transmission of Peary's 8000-word message from Indian Harbor to the New York Times was quoted as a great feat in telegraphy lit took a was quoted as a great feat in telegraphy it took a force of levelly operators three days in a fit the resease librough is the raidd telegraphy system the anne message after being prepared on the tope could have been sent over a single line in about ten minutes?

The high speed methods as worked out by Hughos,
Murray, Polisk Virsa, and Delany elaim 10 word at
the rates respectively of
4 500, 15,000 18 600 and
The significance of these 60 600 words per hour The significance of these methods to the public is that by their use the telegraph could be extended cheapened and popularised until it was as available to the ordinary citizen as the far more highly developed telephone of the present

WYW YORK AND PARTS STRWAY SYSTEMS COMPARED. EW YORK CITY is justly proud of its subway system, but it will be a surprise to some of us to learn that the subway system of Paris us to learn that the subway system of Paris extually carries a larger number of phasen-gers during the year, the total being 333,000,000 as against 200 00,000 cervide on the New York system. Outside of the mere fact that more people were carried the comparison is entirely favorable to the New York subway. The details of the following comparison have been worked out by R II withten, the final trian of the New York Public Barvicas Commission, and they safford upon a most timely subbed is mean of valuable information, which is a creat contract of the comparison of the New York Public Barvicas Commission, and the parison of the New York Public Barvicas Commission, and the parison of the New York Public Barvicas Commission, and the New York Public Barvicas Commission of the New York Publ

piler and cannot rail to or great service to the Commission in its important work of regulating trans-portation matters in this city. There are certain points of similarity between the lwo subways. Both have been built and are evased

by the city, and both are leased for a terms of years to an operating company. The length of the two systems in miles of singls truck depended was in 1869; the year for which the iston figures are available, very nearly equal. But the Paris system, which is entirely-two-track, forms a network of lines covering a district having a radius of three or four miles from the business or traffic center, whereas the New York system has a single seen terminating in two long forts at the upper end, and extending 14 miles to its most distant point from the Brooklyn Bridge, which may be called the chief frame center The Paris subway has no express service, whereas the New York subway has four tracks carrying express and local service for six and a half miles through the most congested dis-

The population of the district served by the subway system was 2,750,000 in New York and 2,780,000 in Paris The area of the city proper of Paris immedia ately tribulary to the subway is 31 square miles, the area of Manhattan and the Bronx served by the area of Manhattan and the Bronz served by the sub-way is £2 square miles. Hence the population of the district served by the Paris subway is more than twice and dense as that served by the New York apriam. There is a total of \$48 miles of single track in the New York and 652 miles in the Paris subway. The great superiority of the New York system is due to the frequency of the trains and the higher speed of travel. In Paris during 1996 the least head-way during reads hours was 5 miles and 25 seconds.

way during rush hours was 2 minutes and 33 seco and the greatest 7½ minutes. The least headway in the rush hours of the express Irains in New York was 2 minutes and the greatest 4 minutes. The man mun length of the Paris train was 236 feet, of the New York train, 411 feet. The average speed in the Paris subway is 12 miles per hour, and in the New York subway, 18 miles per hour, the average speed of trains between Brooklyn Bridge Street being about 24 miles per hour and the sver-age speed of the local trains about 15 miles per hour. Are speed of the local trains about 15 miles per The maximum speed in the New York subway is 40 miles per hour, as against 217 miles per hour in

The rates of fare in Paris are first class 48 cents, second class 28 cents and second class round trip tickets 18 cents equivalent to 19 cents per trip in York there is a uniform fare of 5 cents, but while ride per passenger is from two to two and a half ti that in Paris the fare in New York is 5 cents, the average length of

In Paris the capacity of each car is determined by the government, and in 1908 the awrage number of passengers per car was 64. The capacity of the New cars both scated and standing estimated on th Parls hasis was 10% but this frequently rises to 150, and even 170 passengers per car in Paris the numand oven 170 passengers per ear. In Paris the num-ber of standing places is fixed by the government, in ber of standing places is fixed by the government, in New York the limit is apparently fixed by the ability of a burly platform guard to boost the passengers in by a well-directed football runth limit wore the gov-ernment allotment of floor space, as obtaining in Paris applied in New York, the maximum capacity of a New York subway car would be cut down from 170 to 103 The number of passenger place-unites per mile of track was 73,000,000 for New York and 36,000 000 for the Paris system, and yet as we have seen above the Paris subway, because of the shorter length of the trips carried a greater number of passengers in the

year Congestion in Paris is not nearly so great as in New York, first, because Iraffit is more eventy distrib-uted throughout the day, secondly, because the cur-rents of traffic in Paris move in both directions during rents of traffic in Paris move in both directions during the rush hours, and thirdly, because the passenger in Paris takes a shorter average ride, and vacaies his place for others. The longest possible ride on the New York subway is 1714 miles, though it is not probable that many people take the trip from Atlantic Avenue, Brooklyn, to 222nd Street, New York, for the Avenne. Brooklyn. to 220nd Street, New York, for the pleasure of the trip, and cretaliny not many for business purposes. The total cost of the New York submess purposes. The total cost of the New York submers and the requipment was \$81733,000, cresisting of \$81,280,000 actually paid by the city for the contration of the subway and \$37,845,000 thick its contration of the submay and \$37,845,000 thick it claims to have spend in Lebourge 100,000 that the company rolatins to have appended for both equipment to the submay from Procklyin Trips below Procedure and the Sant River to Brooklyn The total cost of the construction and evaluations of the Paris subways a sectimated at 1843,551-

The New York subway fared much better this Paris subway in the matter of taxes, the former paying hut \$900 per mile of single track as against \$4,200 per mile paid by the Paris subway The New York per mile paté by the Faris subway The New Yerk mulway considered as an economic undertaking earned about 7 per cent on the capital juvested, while the operating company earned about 7 were once as for reported intrestment. The Farth subway casued 7% per cent on the total estimated coet of conjustration and equipment, and the operating company carrond 8 per cent on its reported presentation.

(natically), October, 1909, in 17 months was inspressman are being made in the Trans-Siberian Railway which, in addition to being doubt-ranked. Is being largary reduced with a view to the elimination of grades and the shortening of dis-tance When the work has been completed the chance from Paris to Peking will be 5,000 miles instead of 7,500 miles over the present line size Harbin and Mukken, and the fourteen days now consumed on the reduced to nine and a haif days. The e improvements will be as great from the passonger and freight traffic

Speaking on the relative economy of the single and dire ct-current eyetems for steam ratiroads phase and direct-current systems for steam railroads Mr Gorge Gibbs is of the opinion that maintenance coats of the single-phase system as at present developed will be somewhat higher than for the direct current though eventually they should be about the same. On the other hand, he estimates that about 13 per cent less thangy would be required at the power house for the situations that for the direct constant the situations has for the direct constant. the eingle-phase than for the direct-current system Adding the saving in substation operation, he looks for a saving of from 4 to 5 per cent in the total operating cost in favor of the single-phase system

The tremendous floods of the past season on the lath-mus of Panama have helped to demonstrate, even be-fore completion, the wisdom of building a high level rather than a see-level canal. Through the swamp near Gatun the bottom of a sea-level canal would be near Gatto the bottom of a see-level canal would be some 50 feet below the general ground level, and at Ganbon, where the Chapter River pours its enominan and sudden floods serous the canal cut, the river bed would be 50 feet above the canal bottom. Under the tremttall downpur, the discharge of alluvial silf: into the canal would make necessary constant deciding and might result in the temporary obstruction of the

and might result in the temporary obstruction of the channel.

There is great softwity just now in experimental work in the direction of speed-reducing many formarine torbines. We noted in our facts of February to the contract of the cont

AFROMAUTICS

The latest German airship— Parseval V "—left Bil-terfeld at 10 15 A. M March ist on a voyage to Berlin The capital city was reached safely the 30 miles being The capital city was reached safely the 50 miles be covered in 4 hours. This airship is the smallest n enger-carrying dirigible yet constructed Its rngth is but 30 meters (90 feet)

With the same make of 50 horse-power revolving-cylinder motor used by the ill fated Delagrange, and which drove his machine at the rate of 50 miles ao which drove his machine at the rate of 50 miles an hour, Le Bion few 10 kilometers (621 miles) in 8.74/5 (45.82 miles per houri and Ralsan 6 kilometers (21 miles) in 4.1 (46.39 miles per houri at the first foreign avietion meet of the year at Hellopolis, near Cairo, Egypt Both ware awarded prizes.

The 1910 model Bieriot monopiano has a body only The 1940 model Bierick monopiane has a body only of entering tild forth in leady. The body is compliedly correct There are wide horsential flux on each side at the erest, forming a tall, and the horizontal rodder is in two parts, one of which is hinged to the rear edge of each fin. The tall resembles that of the AltoInstite monopiane, but Bierick allil uses a vectaging threated in body instead of the Valanced forms which imparts to the Antoinette machine its excellent trans

The recent decision of Judge Hand against Paulhan in the Wright brothers' suit, the granting of a pre-liminary injunction, and the requirement of a \$25,000 bond for one month in case Paulhan wished to con-tinue his flights, has put a sudden ond to the making time has fights, has put a sudden ond to the making of exhibition slights in America by this daring record breaking Frenchman. The bond was reduced to \$12,000, but Paulhan's manager although under contract to pay him \$6,000 per week has brought the aviator to New York to await the result of an appeal. The case will be reopened on the 12th instant

Gen. Brun, the French Minister of War a month ago impected at Viliacoublay the four Wright hiplanes which have been hullt for the Freuch army Count Lambort explained the mechanism but made no trial flight because of an extremely high wind. At the same time the army Antoinette and Farman machines were insported at Mourmeion by an artillery officer, Com-mandant Estienne On the 3rd ultimo Van den Born mandant actionse On the 3rd utilino Van den Born made a 36-minute fight in one of the Parman biplanes, carrying a neeful load of 201 kilogrammes (444 pounds) On Mark 1st Lieut Cammaran of the Engl Beer Corps flow 38 miles in a similar machina. Birliot also has been instructing Lieut. Aquaviva with ett.com

A man who has made a thorough investigation of the accident to the Bieriot monoplane which cost tha life of Leon Delagrange, has concluded that the acci-dent was the result of the aviator griting "rattled for an instant when he was flying low and was about to turn it is this man's belief that Delagrange threw turn. It is this man's belief that Delarrange three the same lader this warping the wings too much and tipping his machine severely—and than to art to the other the result being that machine seward so violently that it turned over it struck the around quested own, and all the guys ele on the under side were found intact. A spering air with the around the side with the same side with the same side when the winds with the same side when the winds with the same side w been left out) was found in place and unbroken. As far as could be ascertained, everything was in good order and the accident was not due to the failure or breakage of any part of the mechanism.

Now that Germany has produced several "men birds" many new acropiane inventors are rapidly appearing. The majority of these favor the monoplane, with which type the first \$10,000 cash prise (the Lam prise) was won by Herr Grade last tail. Dorner and Hilman are won by Herr Grade laght fail. DRIVING PILES WITHOUT A PILE DRIVER

BY GEORGE H. LODGE

It may be of interest to many of the readers of the Scivitize Assessant to learn of an easy method of driving piles through the ice without the use of

Those who have tried to drive even a small post Those who have tried to drive even a small post by hand while working in water or from a small boat have found it much more difficult than one would at first suppose. I was myself confronted with the problem of building a dock landing for a lake steam bestle a steamboat built to carry 300 passengers, be-ing 70 feet long. The problem was to build a dock or landing safe and large enough to handle the people

rapidly

First we thought that it would be necessary to hire
a pite-driving outfit, but my father, R. H. Lodge, devised a plan that works to perfection
We select straight withte oak piles not over one foot

We as let straight white oak piles not over one root in diameter at the but which are unt to the length required usually from 20 to 36 feet. These are sharpened at the butt ends to a point sod with an κ κ through its out from the point of the stick back from three to four and one-half feet, according to the size of the pile

it is important that the threads be cut as nearly the same distance apart as possible. A good man with an ax can soon cut threads that are mechanical. il is asionishing how many, with a little practice, can It is assonishing now many, with a little practice, can be cut in a day. It pays to use special care to the cutting, as it beine wondorfully in the driving. Piles that are from ten to twelve inches in diameter should have threads from three to three and one-half inches apart and Iwo to two and one-half inches deep

apart and two to two and one-nair monds deep After the inreads are cut the pole is ready to drive, which is done by chopping a hole through the ice at the desired apot, being careful not to make the hole the desired appl, being careful not to make the hole-one two inches larger is diamoter than the pole, and have the few act as a guide to keep the pole upright while arrewing in down.

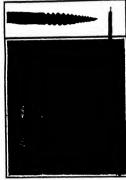

If the pole is long and heavy, it is necessary to fasten three guy ropes to the top of it before raising After the pole is raised, it is an easy matter to keep it plamb by quilling the ropes.

The pits is raised like a roumon (relephone pole to there works, a little at a time with pike poles, follow

ng up under with two planks spiked together in the n of an X.

form of an X.

It is a good plan to stand a plack in the hole and to let the point of the plie rest against it, as it assists in placing the plie in the desired spot

DRIVING PILES WITHOUT A PILE DRIVER.

It is also a great help to spike a short plank acro the pile, temporarily, just above the threads, to keep the pile from shooting under the ice before it is vertical whereupon it may be knocked off. The pile

will thee drop into the proper place Now you are ready to bind a pole (or sweep lever)

to the pile. This is done with a common log chair, care being taken to bind it so that it can be serwed in the right direction. Hitch a sharp-shod horse to the outer end and lead him around the pile (capatan

fashion)
It is an easy matter now to serve a large pile from
four to sight feet into solid clay or gravel or to unserve it and remove it

The accompanying photographs illustrate the woodsub-radir radio for use, and the plan of servering in
stream radio for use, and the plan of servering in
offen put in smaller poles by hand, using two of
three mes instead of a Borne.

We have roomity taken out two steamort to posts
that have been in use for sight, years, having begun
to decay. These unserveled posts we found had been
sary to hitch the lever below the water line, where
the wood was secured, in order to chart them.

the wood was sound, in order to start them.

To the Cairo Scientific Journal for January last

Mr B P E. Kesting communicates an interesting
paper on climate changes in Egypt. There is a strong
sileif among residents that changes have occurred
within the last ten or twenty years (possibly due lo
increased triguistion) which are distinctly "sensition" to
the mean temperature at Abhamis for each pentade
from 1870 to 180, and for the foor years 190.5, to
the results show that the differences are hardy
restart than might be caused by difference of expsure of the thermometers. As regards humidity, size,
there is very little evidence of each of the comterm is represented by the company of the comterm in the company of the comterm is the company of the company of the comterm is the company of the company of the comterm is the company of the company of the comterm is the company of the company of the comterm is the company of the company of the com

the company of the com is little, if any, evidence of such being the case. The total rainfall of any year is often influenced by the total raintal of any year is outen inneneese by tail on a slopte day, and is consequently very variable from one year to another, the driest year on record at Abbasais at 1858, with little more than a quarter of an inch of rain, and the wetner, 1904, with loss than 3 inches, the mean for 1887-1908 being approximately 1.5 inch.

AN ARTISTIC REINFORCED CONCRETE BRIDGE

A COMING TYPE FOR COUNTY HIGHWAY BRIDGES

In country districts where the materials are readily accessible the reinforced concrete bridge simuld prove to be an ideal system for the construction of concrete bridges of moderate span. We say of moderate spau, for the reason that the art of trussed bridge construction in reinforced concrete is as yet in too early a stage of its development to warrant its indiscriminate use in bridges of considerable span. In structures of moderate iough, say up to about eighty or a hundred feet, if care is taken to proportioning the parts, especially at the joints, and very particular care is taken

in securing a thorough between concrete and steel, the county com missioners or other su thorities should find the ocrete steel bridge a reliable and economical type. It is easy to erect, it requires no painting and practically no mainleo ance whatever, it is in destructible by fire or the action of the weather, and its subsequent cost fer maintenance should be practically nothing at all

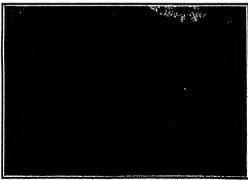

The accompanying illustration shows a bridge of this class of the bowstring type which was receolly built in Caosda. It has a span of 80 feet and provides a clear roadway 16 feet wide. The total weight is about 160 tons, and it contains about 19 tons of reinforcement in the form of plates and round rods.

The bridge was designed to: carry a load of one bundred pounds per

square foot evenly distributed, and it was tesled for this load with an additional load of 35 tons repred hy a herd of 70 cattle

On the score of appearance it must be conceded that the design is decidedly pleasing the intersection of the balustrade with the chord and web members having been worked out with considerable taste. The structure spans the Etobicoke River, in the counties of York and Pecl. Canada

No sooner had the first modest attempts to steer

or less success, than endeavors were made to direct the course of balloons and seroplanes in the same the course of balloons and seroplanes in the same manner The American engineer Anthony has made axperiments off Sandy Hook, with a small unmanned dirigible balloon, which he succeeded in guiding more than a mile seward and hringing back to the point of than a mile seaward and nringing back to me pount or departure Prof Wicchert suggests the employment of unmanned aeropianes for the study of atmospheric alectricity and has designed an apparatus of this kind it is obvious that such an apparatus, equipped with the necessary instruments,

the necessary instruments, which could be sent to great heights without dan-ger and brought back with cartainty, would be much more useful for the study of the atmosphere, as especially that of atmo pharic ejectricity, than un anned registering balmanned registering bal-loons, the recovery of which is always a matter of chance, or manned bal-loons and kites, the use of which is not unattended of which is not unattended with danger in stormy weather Bailcogs con-trolled from a distance by alectric waves would also be very useful in the res-cue of shipwrecked per-sons and for many military and other purposes. But —and this objection ap-plies also to the wireless divertion. plies also to the wireless direction of ships and torpodoes—it is a long step from successful ex-periments in favorable con-ditions to uniform suc-

Instrument for Detecting Violations of the Speed Laws

BY L. GORDON GLAZIER

A very ingestious instrument for recording the speed and license number of an automobile has been expressed and license number of an automobile has been expressed in the stations of Technology. The instrument, which is but little larger than a pootet tooks, consists of a desired commers with a watch movement which controls the operation of the centers shutter. When an automobile passes at a speed that seems assessive, the operator trains the instruments until and releases the mechanism by pressing a hutton, immediately the shutter of the more camers is some

stely the shutter of the upper camera is sprung

DOUBLE CAMERA WITH WHICH VIOLATIONS OF THE SPEED LAWS ARE DETROTED.

taking a photograph of the receding automobile, ar taking a photograph of the receding automobils, and a moment later the other shutter is aprung, taking a second image of the automobils, whereupon the timing machanism comes to a stop. The plate is developed by the regular process, and the resulting negative shows an image of the automobile near the operator with its license number distinct, and a second view with its invesse number distinct, and a second view of the machine taken at the end of the time interval In the center of the print are the photographs of the hands of the stop watch caught when the first and second exposures were made.

Since the automobile has traversed a certain space

in the time interval, the second image is smaller than the first by an amount which can easily be measured with an ordinary scale, divided in hundredths of an inch; and knowing that the standard wheel tread to 66 inches, the distances of the two objects from the camera and hence the space the automobile has covered in the time interval is easily found by the following law The distance of any object from the reliouving line. The distance of any object from the iens is as many times greater than the forcal distance of the camera as the length of any line of the read of the camera as the length of any line of the read of the camera as the length of the property This known assumely, the size of the object the size of the intege of the object on the plate, and the distance of the object on the plate, and the distance of the object from the lens, follows by almple division. However, the operator is smed all principum computation by a table stateled to the instrument

to the instrument

To overcome the possible objection by the couris,
the watch has been designed so that the operator of
the instrument may actually see it during the process the instrument may actually see it during the process of taking the picture. This is made possible by aim ply borting a loole from the outside of the camera box to the back of the watch, which brings to visw a dial around which travels a hand attached to the amplitude of the watch in the picture of the watch piloton or staff as the regular hand of the watch in order to see this dist more plathy, two mirrors have been pisced permannity! in such a manner as 10

The instrument gives extremely accurate results, and can be calibrated from time to time on objects of

welcomed by autoists as well as police. It is an im-partial judge the personal element being entirely eliminated. A motorist who has been stopped does eliminated A motorist who has been stopped doce not have to rely on an officer a ceilmate of the speed, nor on the speed claimed by the officers operating a trap by means of stop watch and signals * Donesn of motorists are flighting (asses overy day who honestly believe that they were not overspeeding when stopped They would be perfectly willing to just their final it convicted they was adoluted that her. Even stopped lacy would be perfectly willing to jay their fines if covrinced they were violating the law Even where the more rational view is taken that the speed sions shall not determine whether or not a man is violating the law, but that the speed taken in connection with the surroundings shall determine it it is tion with the surroundings shall determine it it is stating a quotient on the officer's word against always a quotient of the officer's word against as to surroundings. This photographic speed of autious's as to surroundings. This photographic speed speed to see the automobile whether people were created speed user the automobile whether people were creating group to run at the speed indicated, or more than ordinarity sate.

A great advantage of the instrument is that it recording the speed of the speed of

similar situations, it offers the only existing method of measuring momentary hursts of speed. The record of measuring momentary hursis of speed. The record of any reckless driver can be easily obtained and a print sent directly to him, when he cannot deny the evidence of his own eyes, and in many cases an ar-rest will not be necessary, as the offense will not be

Regarding the legality of this speed recorder in a rocunt case that was strongly contested Judge Ham

mond of the Massachusetts Supreme Court said "The result of the evidence did not depend upon the fluctuations of human agencies nor on conditions where relations to results were uncertain, but upon the immetable working of natural laws, and upon the

SPEED OF AN AUTOMOBILE SHOW COMSECUTIVE PROTOGRAPHS

evidence the presiding judge may well have found that am h experiments were likely to be more reliable as to the speed of the automobile than the conjectural statement of an eye witness or the interested states

Racetácial Complianeate Faist to New Buildings in A superstition that still arvelope a great part of the searth as that envisors a great part of the searth as that envisors are produced to the search as that envisors are produced in the search principaling a living creature, preferably a h-sman being, in one of the walls of the building that the hand being, in one of the walls of the building that the This build, which is particularly prevalent in the Raikkan penimula and, for instance, has given to the Councaina Queen, Carmon Sirvi, Raikerial for one of her most beautiful folk takes, has not been known as being had any hold in Tally thicker's Recently, in the course of archeological research, it was found that in the foundation of the Temple of Fortune in Pompell in the foundation of the Tempie of Fevirus in Penguid there was a hollow space in which nothing other than the the thin the space of the thin the space of the thin the space of the space of the space of the precise immurement of a forticle, which was exhaused by the disposition of the square blocks of stone of the creature's prison. In Test this superetition may have penced at an early day into oblivion, as the smedder of human beings was foreign to the Roman religions of human beings was foreign to the Roman religions and was precised occasionably only made Ornels. In all was precisioned consinuation and year made for the answar precision occasionable of the space of the space of the nameng the old Greeke was not remand, high in decrease, as well as in the adjacent countries the windiction of specifics to now buildings is still instanted, it may be

believed that in old Greece also the sacrificial comnestored task in old utreece also the sacrificial com-plinent to new buildings was not unknown Instances of this kind of sacrifice in antiquity are certainly not frequent, all those of which we have any knowledge are attributed to the Greek Orient Usussity a mattern was sacrificed who, at the same time, became the guardian apirit of the structure. For this reason Trajan effected scorinced who, at the same time, became the grandina appried the structure. For this reason Trujus effected the girl who has been scriftled on the occasion of the reconstruction of the city after an arrhbquish and was designated as Tyche, the Goldess of Fortuse of the season of the sametifice. It is this fields which still lies to-day at the root of this superstition of ascribed compliment. Solidly a human being is incased in a wait of a besser of the motion, which the continue the same time of the same time of the same time. The same time of a such immediation. The human scriftles have the place of such immediation. The human scriftles have the place of such immediation. The human scriftles have the place of such immediation. The human scriftles have the place of such immediation. The human scriftles have the place of a person, or of the shadow, and immerring the string representing the measure or by leasing in the wait as assumed already killed or still alive. Manifestly petition complete the properties at the human scriftles are the preparation of the human scriftles are the place of person, and probably the tortices was scientised because this animal can live a long time without new indeer effective the longer the entombed creature lived.

When death is caused by hanging what propor-tion does the pull to which the rope is subjected dur-ing the struggles of the victim bur to the weight of the body? This novel question has been asked and answered by experiment by Dr. Angelo de Dominicis. answered by experiment by Dr Angelo do Dominicke. The testation is used: case was measured by a dynamo-meter attached to the rope. A living dog, suspended in such a manner that it remained quiet exerted a pull of 20 pounds, but the subsequent "hanging of the same azimal produced a puil of 42 pounds. With a larger animal the corresponding tensions were 50 pounds and 103 pounds.

Hence it appears that the convulsive movement Hence it appears that the convulsive movements of the victim may increase the tension of the rope to more than twice the weight of the body. This result explains the occurrence in the bodies of persons killed by hanging of serious lesions which it would be dif by hanging of serious testons which it would be dif-ficult or impossible to produce by hanging up a corpse. The strength of the rope must also be taken into account. If a body is found suspected by a rope the hreaking strongth of which is little greater than the weight of the corpse, it may fairly be informed that the body was not suspended until after death Hence the experiments turnish valuable data for determining the cause of death in such cases and will puthably be made use of in some future detective story.

JUPITER AND HIS SATELLATE

BY PROF. FREDERIC R. HONEY, TRINITY COLLEGE

Jupiter and his satellites commu Jupier and his satellites command expectal atten-tion at the present time, owing to the fart that this greatest of all the planets and second only to Venus in brilliancy, is approaching opposition which will be reached on March 30th Jupiter will then be

be reached on March 30th Jupiler will then be both morning and ovening stars.

The comparatively recent increase in the number of Jupiler's eachiltee from four to seven and pos-sibly eight as revealed by the growing power of the triescope directs the astronomer curl one scrutin upon the Jovian gratem. The

one screen upon the Jovian system. The suitilities which is nearest the planet revolves around its great primary in the short space of twelve hours, at a distance of only 68,000 miles from the surface, while the outer most moon shows its outreme remotes from its center of attraction (the enormous distance of 7.35,000 miles). distance of 7 430 000 miles) by a revolu Hon requiring 265 days. Thus is exempli-

fied a perfect conformity to Kepler's naw.

A small magnifying power reveals the alliptic
ouiline of Jupiler, whose polar depression is ex
reus by marked the equatorial and polar diameters showing a difference of over 5000 miles

in the plot of the orbit Jupiter's position is shown for the date of opposition, which is very near sphelion, also for the oppositions from 1802 near sphelion, also for the oppositions from 1802 to 1911 inclusive The average interval between oppositions is 399 days. But, in obscilence to Keylars ascopid inw. the planets velocity at aphelion is distributed by the court of the court tions, which occurred before and after the hollon passage were respectively September 11th, 1903, and October 18th, 1904

The five inner satellites revolve in orbits whose planes very nearly coincide with that of Jupiters squalor. This plane forms a small angle with the eclipite, and may be represented approximately by a straight line (Fig 1) The distances from Jupiter to the satellites are represented by the same scale as the planet. It is impossible to show the positions of the two outer satellites by this scale within the limits of this page, since their distances from Jupiter

or this page, since their distances from Jupiter are over all times that between the plant and Califate. It should be noted that all the satellites are nearegen the same side of the planet at the same time, as shown in the flaguer This view of the satellites are nearly strong the satellites or believe the satellites or believe the satellites or believe the satellites or believe the satellites of the plant of the order of the order of the order of the order of the satellites of the satellites of the satellites, and at every revolution of each satellite there is alternately at runnal across pupilers alternately a transit across Jupiters disk and an occultation by the planst Fig 1 shows Jupiter and the orbits as seen from the earth in 1908 in 1902 this figure was re-versed During Jupiter's revolution versea During Jupiters revolution around the sun in 1186 years, the planet and the satellites are continually changing their positions relative to the ecliptic The plane of the orbit is inclined at an angle of 13 deg , and that part which is above the ecliptic is represented by the full line The line joining the points N and N' (the as descending nodes) is the intersec-tion of the plane of the planet s orbit with that of the ecliptic In Plot 1 a visual ray A from the earth tau-

gent to the planet shows that, seen in this direction, Callisto is no longer occult od by Jupiler Between the positions A and C, and between B and D, the orbits very gradually open out to the elliptic form, and at C and D

open out to the citiytic form, and at C and D the length of the minor rais reaches its maximum Fig 2 represents the orbit of Callitic when the matching to longer suffers occulation by Jupiter Committee of occulations of occulations evidently begins some time mum width. But the diameters of the ordits of the four inner satellites are smaller, and with them transits and conductations continue. There will be no occultation or transit of Callitate or its shadow this year after January 55th. On this day the shadow was projected on Jupiter between 5 h 1tm and 1g. 5 m. In the point of the orbits of Jupiter and of

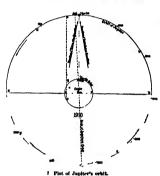

the satellites the general directions of the lines of vision from the earth before and after opposition are indicated by arrows.

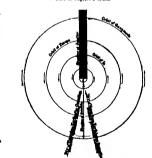

Obviously the planet does not occupy the same

continuity the phase need not comp the before and after opposition. But if this page be related elockwise and counter clockwise through small angles, one posttion will represent Jupiter in his orbit before, and the other that after opposition Before opposi-

Relative positions of Callisto, Jupiter and the Earth.

That the controlling device That the controlling devices for a single-phase or equipment and not be more complicated than for a direct-current car, retases the Sheetz-current World, will be apparent at once the single-phase of car can be applied immediately to the former without alleration. It is existent that it is a single-phase to reading a sufficient to the single-phase that the single-phase they equally as satisfactority as to those of the direct-current type as the single-phase they equally as satisfactority as to those of the direct-current type.

as satisfactority as to taces or use directoursait specific and Morrorer, with the alternating-current equipment it is possible to substitute reactance cells for the resistance of the rhecetax, and thereby eliminate a considerable portion of the energy dissipated as heat in the emitted circuits during socieration. In addition, with the portion of the energy dissipated as heat in the outcome circuits during acceleration. In addition, with the shape-phase car there can be obtained, conveniently any desired number of voltages to be jumpissed upon the motor circuits, and there is thus no insensity pu-tal matter of the property of the property of the familiar the E. M.F. to a staple value, for this late of the convenience of the property of the property of the matter of the property of the property of the convenience of the property of the property of the convenience of the property of the property of the convenience of the property of the property of the property of the convenience of the property of the property of the property of the convenience of the property of the prop

A REMARKABLE PERSONNESS.

Fig. the Billion of the Summerous Assuments.

The has been desired the management of the Summerous Assuments of the "remarkable phenomenon" in the summer of t communes my sur. V. J. Laints, in which a rainbow was sepan to be disturbed after each peal of thunder. Mr. Lefswar explanation, based upon the change of size of the rain-frequ, is apparently unwarranted, insamuch as according to the old and generally accepted optical theory of the rainbow, the angular position of the voters of the how relative to the direction of the sun

and the observ the rain-drops, rver's eye, is independent of the size of

the rain-drops.
To the writer the phenomenon is more plausibly explained by recognizing the atmospheric disturbance in the lits of sight of the observed case the tenderbolt. The light, after dispersion by and reflection from the rain-drops, passes through all which is agitated by the occusions following the lightning stroke, and the interpas count waves radiating therefrom The result diar to that seen over a hot surface, as a stove or heated field, where the convection currents dist

or heated field, where the convection correctle distort the light rays averening the corryling air.

While it is true that ordinary sound waves do not affect the density of the air audicently to deviate the course of light perceptibly, the violent expansion and contraction accompanying a thunderbolt may produce the result. The peculiar circumstance in the sear referred to it take the atoms approached from the east, opposite to the sun, so that the tightning discarges, which are generally in the advance portion of the atoms cloud, cocurred in the violent portion of the reliable, whereas ordinary or the search portion of the reliable, whereas ordinary on the product of the reliable, whereas ordinary on his passed over and the lightning is taking place in the distance beyond.

W. H. Howano, Washington, D. C.

THAT OURIOUS WATER PHRHOMEROF.

To the Editor of the SCHRTIFIC AMERICAN
I observed a similar curious phonomenon to that ted by James S. Lee in your issue of January reported by Jamus B. Lee in your issue or January 29th Mine was observed from a train going west through the great Alkali Desert in Newada. The desert floor is of sand, and flat, as though laid by desert foor is of and, and fist, as though laid by water I nountemble desert or back grass mounds overed perhaps ten per cent of all the surface. These mounds or dense vary from six to twenty foot in diam-eter by one to two foot high It was about five o clock of a warm September afternoon I motiond, looking westward and nearby, what seemed to be a small but powerful stream of

water or fountain, going to perhaps twenty-five feet in height. Close observation revealed many hun-dreds of those fountains. As near as I could make dress of these foundains. As near as I could make out, there was one from the centre of each of the and dunes, varying it size much as the sand dunes varying it size much as the sand dunes warlet processes of the countain were really formed by cipient cycloses currying sand, not water, in small streams, somewhat in the shape of elender long-waisted bourglasses, spreading at the top to fail to earth. These varied from twenty to fifty feel the fact, the continued of the continued to the continued to the continued for ten miles along the time.

The continued for ten miles along the time of the continued to the con them? I suppose the floor of the desert was several degrees cooler than the and dense, which had been absorbing solar heat rapidly all day As evenies; approached, the warmer air over the dense rese-rapidly, assuming the natural spiral metion, licked by warm dry sand, and made a most beautiful pic-ture. The passengers gased and wenderd "why. Will the Editor please give the cerrect cause if mins, as given, is theoreted?

AN ELECTRICAL FEVER RECORDE

BY DR ALFRED GRADENWITZ

Fevor, i.e., the rise in blood temperature attending certain maladies is known to be the outcome of a spontaneous reaction on the part of the body against the microbes invading 11. The opinion is therefore, erroneous that fever in all cases should be acted against in order thus in subdue the morbid state of the patient. Nevertheless it is of the highest import-ance that the physician be kept informed of the variable temperature of the blood

According to present practice tempora-ture readings are taken at regular intervals, say three or four times a day by a sensi-tive thermometer. This practice obviously gives no information as to those oscillations Lives no information as to those oscillations in temperature which may have occurred in the meantime and which, in some cases, it would be desirable to know A process allowing this important factor to be recorded continually and automate ally therehem of Herlin constructors, Mesers Siemens Halske, have recently perfected an ap-

a tained, nac result perfected an ap-part the achieving this result. The apparatus is based on a very simple principle via the alteration in the elec-trical resistance of platform wire by variations in isomerature. It comprises in addition to a coll of platinum wire a Wheatstone bridge and a self record ing millivoltmeter

r militoritancer
The pintinum coli is either introduced into some The pintinum cold is either introduced into some of the earline of the body or fixed on the body. A couble conductor of low resistance connects the coll with the bridge and millivoitmeter, which execute any variations in the resistance of the platinum

any variations to the resistance of the platinum vites and accordingly the temperature of the body. The surrent required to feed the apparatus is sup-posed to the control of the control of the con-relation of the carries and the control of the con-sistance with cearse and fine adjustment. As the normal range of the recording apparatus comprises the interval to

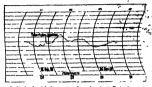

the interval be-tween 10 dog and 45 deg C the curves registered are of sufficient are of sufficient distinctness for any therapoutical and solentific purpose The electrical

fevor rocorder is constructed in two different ispen in the first

type, the rotating voltaneter is sus-pended from a stric of metal, the curve being recorded on a paper tape about 45 meters in in meters in iength which is newed along by a clockwork at a speed of 20 millimeters per hour of the tape is 120 mtillmeters low the paper tape there moves under the action of a clockwork an luking rib-bon, over which er carrying at its end a runner The position of the pointer in each minute The series of points

forms a distinct curve The clockwork should be wound up once a week, a new paper roll being inserted every three

The second type conturises a relary roll located The second type contrises a rolary roll located between points, so that the apparatus is insensitive to any moderate oscillations widle not requiring accurate horizontal adjustment—the registering tapo is wound together with a sheet of carbon paper round a drum. As in the former apparatus, a style marks time. The apparatus is designed either for a rotation of the drum (about 360 millimeters in periphery) in about 7 days or in 24 hours. The paper tape and carbon should be exchanged after each turn, which

Record obtained with fever recorder, showing effect of

in accordance with the rotation speed of the drum. in accordance with the rotation speed of the druin, and takes place either every 12 or every 2 minutes in order to atlow for both speeds, the apparatus can be fitted with two drums, exchanged against each other by a simple manipulation. The useful width of the super tupe in this case is about 80 millimeters 1 e, somewhat ioses than it connection with the former type. This is why the one is generally used for accurate, adentific investigations and the latter for ordinary clinical apparatus.

The United States Hydrographic Bureau and Coast Survey has charts of the Great Lakes and the Atlan fit, and Pacific, coasts which are consulted eagerly by

time and sult water capital derivatives are lader with over at gen but not so generally prised by the spelter. On the Great Lakes alone positions of wrocks are charted w positions of wrecks are charted which con-tain many millions of collars in buildies and ore. There is no vigue smoortshirty about these treasures. They were known to cents in the holds of the ships, and no man has yet been sale to recover them. The steamer "Pewahle," for Instance, which went down in Lake Huron in a storm in went down in Lake Huron in a storm in 1985 carried with her haif a million dol-lars worth of copper from the Lake Super-lor mines For three decades expeditions sought to find the wreck, and finally it was

iocated about six miles southeast of Thunder Bay. But the wreck was in such deep water that only a very small fraction of her cargo was ever recovered Here is a submarine copper mine which might tempt

the most adventurous soul to risk his life in gaining.
The chart of wrecks on the Great Lakes compiled
by the Hydrographic Bureau and Coast Survey shows ly the Hydrographic Bureau and Coast Survey shows the relative depth of water and this simple record ris the whole story of why outerprising man has not been able to receiver them. Divers seeking treasures in surken vessels have learned that anything which lies much more than 100 feet deep is very difficult, if olutely impos to recover The pressure of the water beyond that depth becomes so great that diving suits are upt to collapse and crush the wearer We know from a study of the charts that hundreds

of ships leaded with tressures have sunk in wa ter ranging from 100 to 250 feet in depth and if div ing suits could be invented to withstand the ener sure at the lowest depth and enable the diver to work easily, tunes could be quickly made The whole his-

of tree hunting under the water has been marked by man's futile ef-fort to fight against the pres-ture at great depths. One hundred feet below i, the pres divine

with brackets D, in which are slots adapted gage hinge pins secured in the side-rails A. slot and pin commection provides the necessar when the ladder is collapsed. The pins on wh ed to esor play when the ladder is collapsed. The pins on which the steps are hinged its at right angles to the rails A, and in order that the trust surface may be horisontal, the steps are made of a substantially wedge shape, as indicated in the illustrations. The top or platform if of the ladder is also hinged to the rails at the He of the ledder is the hinged to the rulls at the points FF, which list on an area at right angles to the rails B. To support the ladder in its normal isolated positions, two legs G are provided The legs are connected by the usual links H to the rails A, and at the upper ends they have attension pieces that shorton the indexr, these extension pieces with the upper rails B are withdrawn from their sockets. Then a top piece, such as indicated in Fig. 2, is applied to the ladder, the four about logs of this probability is sufficiently and the service of the rails A. The last G are withdrawn and hast to the rails and also through the logs of this provides and also through the logs of the rails and also through the logs of the rails and also through the logs of the rails and also through the logs of the ray are reand also through the legs of the top piece. In your want the logs of from proceeding too far they are re-tained by means of brace bars K. The links H in this case are unnecessary and are folded upon them selves, as indicated in Fig. 2. Mr. William J. Diru-dell Box 182, Brooklyn, N. Y, is the inventor of this improved size ladder.

MOVEL CURRENT WHEEL.

A number of advantages are claimed for the wheel illustrated herewith namely that it does not require the use of dans, it regulates itself to the rise quire the use of canal, it regulates tests to the street, and fall of the street, use only the surface current, is equipped with reathering blades, and is provided with means for preventing the parts from freezing fast in cold weather The water wheel is supported on pontoons, as indicated at A in the illustration.

The postcons are connected by means of links or parallel arms B to a fixed framswork supported on plies driven into the bed of the stream. Fig 3 shows the construction of the biades used on the wheel The spokes of the wheel are arranged in two parallel sols which are bifurcated at their outer ends. The blades which are bitureated at their outer onds. The blates of are higher to road connecting the parallel spokes and have free play in the hitureated portions. The blades to accommodate themselves to the current so that there is no litting of the water as in an ordinary water wheal. It will be ordens that as the water rises and falls, the wheel will like and full with it so that the blades will playays extend to a uniform rise and falls, the wheel will like and full with it so that the blades will playays extend to a uniform that the blades will playays extend to a uniform that the blades will playays extend to a uniform that the blades will playays extend to a uniform that the blades will play a possible the soft with the playage of the soft play the play reflected as follows: On the upstreams size of this structure a wing O (Fig. 2) is built not dissuredly into the stream, so as to direct a large portion of the current between the positions and against the water wheel. In this wing are a number of food gates if connected by mesh of a way that as the value reflect the spice will open, permitting the water rises, the gates will open, permitting the water in flow through them, and thus cutting down the current that strikes the wheel To protect the parts in cold weather, a casing is built over the wheel, at the loop of which is a suction fan F. This is builted to the whole as shown in Fig. 2 Through a duct of a current of warm air is conducted to the interior of the casing by issums of the fan and delivered through the pipe H as indicated by the arrow At the up- and down-gives addes of the easing, hoods J are placed, which opus slose to the surface of the water, and precent the dath bear drawing in cold air instead of the all

hrough the duct G The inventor of this improved rater wheel is Mr W P Spooner, Box 3 "The Manse," arloyale, Saskatchewan, Canada.

CAR-RETAINING DEVICE FOR RAILWAY GURVES.

CARRITATING ENTICE FOR RAILWAY CHAPAS.

In order to leasure the safety of cars when rounding curves, and to prevent the car wheel flanges from
saving under frictional engagement with the rails,
a safety mechanism has recently been invented, which
is pictured in the accompanying cugraving: It consists of a central rail A, that is supported on the time

WETPOD OF BETAINING CARS AT CHRUPS

ed is atrongly braced by means of anchoring deand is atrongly braved by hierars or ancoroling de-vices B, which are imbedded in the around and term-inate in plates C. The object of three plates is to prevent the anchoring devices from working upward. The illustration shows a portion of a car truck pass-ing over the rail A. The acts of the truck are con-nected by means of auxiliary trusses D, below the main trusses, on which blocks & are supported Demain trusses, on which blocks h are supported De-eigned to travel around these blocks E are sudicas chains h fitted will rollers. The rollers are pressed by the blocks E against the guide rail A. As the truck peases round a curve the rollers lend to keep It in place Ordinarily the forward wheel on the outside of the curve tends to bear sgainst the rail, owing to the fact that it is rigidly connected with its n the other side of the curve, and hence it cann mate on the other side of the curve, and shown it cannot travol fraster than the latter. The result is that the fange on the outer wheel is subjetted to considerable war. The centering device how shown, however will prevent the fange of the outer wheel from being and up present against her rails. The guide rail serves to prevent spreading of the rails, and keeps the curve to the contract of the den of Pulga Cal

MARGAGE APPARATUS.

d upon a dovice A patient has reactify been granted upon a dorties for securing a whrater to the hand for application in the operation of measure. The apparatus may be adjustable to adapt it for me by different persons and may be securely champed to the hand, so as to impart to if the whratery movement that is used in certain measure trainments: As shown more particularly in Fig. 2 which it as cross section of the dovice with the witnesser reasoned it comprises a padiest custom the best of the down of the contract of the contract of the down of A parent has recently been grant desired The plate C is formed with two lugs, between which is mounted a screw of and the lister is previously it may by ided with a knurled thumbplets, whereby it may be

turned. The plate B is fitted with a nut H that so turned The plais B is fitted with a nut B that se ages the serve, and as the server is turned the plates are relatively adjusted to bring the horns closer or move them farther apart is this way the device may be clamped on the hand The cushion A, how-wer, renders the device compretate to the operator Projecting from the forward and of the device is a bracket. I as indicated in Fig. 3. to which the vibrator bracket, I, as indicated in Fig. 3, to which the wibstance mechanism is applied Fig. 1 shows the preferred form of vibrator, which has a threaded stem that engages a socket in the bracket I A forbitudy I serves to make the vibrator fast. This type of vibrator is consultant to the vibrator fast. This type of vibrator is consultant to be the consultant to the consultant t

STREET INDICATOR FOR CARS.

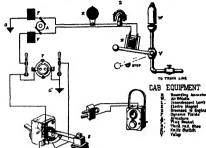

the desirability of having the streets announced by means of a completious sign in a street car has often been urged but littlerto efforts in this direction have Down urgon our surface enters in this direction have net with little success Quite recently when a device of this type was about to be adopted on an important city line the objection was raised that it would ob-struct and detract from advertisements placed in the This objection is overcome in the apparatus cars This objection is overcome in the appearance above in the accompanying angavatings, which not only announces the streets but also displays advertisements at the same time. The interaction house that by making the derive self-paying as well as a convainance to the public, it will meet with botter favor than street indicators hereidors deviced. The prominence of an advertisement placed where all eyes would be concentratively predicted the product of the form of the product of the form of the product of would be concentrated upon it should make this a most valuable advertising medium it is the in ventors idea to use a succession of advertisements so that the display could be changed at each street with the street number. The sign display and street indicator is arranged to be hung at any suitable point

間でっていている。

The railreads have long recognized the fact that what is needed in not manshine to take the place of the engineer, but one which will act an a check under the sugiceer without taking the responsibility from his abcorder—a system that will perform the angi-neer's needs in the con-

any lapse on his part and make a record of this lapse so that the responsibility for fail ure on the part of the engineer will be de-terted A system of this sort was recent iy installed for pur poses of experiment over a abort stretch of the Eric Railroad from the Erie Railroad from Newark to South Patar son. The system is quite ingenious in the fact that it gives protec tion against broken tion against broken rails as well as colli sion, and furthermore is provided with tele onables the engineer to communicate with sta-tion houses along the line when the train is brought to a stop for any reason and oven while the train is run ning at full speed. The advantages of this tele

phone system will be appreciated by passengers who pinnin system will be appreciated by passengers who can use it to communicate with their homes or to conduct husiness while on route and the train dispatcher is sushied to come into direct touch with the various units along the line which are under his in this system the track is divided lute block sections, and the train as it enters each block else trically tests the block shead to determine whether

STREET INDICATOR FOR CARS.

1

in the car and immediately after passing a street the inclination is actuated to amounce the next sirvet and display a fresh advertisement. This change is effected by means of contact plates which are secured effected by means of contact plates well as we see to to the tross wives supporting the trolloy wire. The contact plain engages a spoke of a wheel, causing the slatter to make a quarter turn and momentarily close an electric circuit coming from the wire that supplies current in light the car. This momentary impulse activates a relay in the apparatus contained within the came of the indicator, and by means of a small electric motor the webs on which the street numbers and signs are printed are turned to the required degree signs are printed are turned to the resulted degree should one of the plates become deathed from the cross wire the conductor can operate the indivator by usans of a switch. When the end of the line is reached the mechanism is reversed so that the street will be announced consecutively in the reverse direc-tion. Behealt the car rows a different set of streets on the return rips, instead of ramping the web forward for the whole round and then rewinding at the start ing point the web may be arranged to bear the streets of the return trip interspersed with the streets of the forward trip and a shutter may be employed to cover rorware trip and a shutter may be employed to cover the streat names of the first part of the trip, exposing only those of the return trip. The inventor of this circest indicator is Mr. It Aiwles, 214 South 11th Street, St. Louis, Mo.

AN AUTOMATIC RAILWAY SAFETY SYSTEM.
It is a comparatively simple matter to develop an absolutely automatic railroad system in which the engineer will be entirely dispensed with and the trains will run under electrical control from some central win run under electrical control from some central controlling station. The reason this has not been done so far, however is because no entirely antomatio engine ig as safe as one controlled by an engineer are is any obstruction on the rails or whether the

The moreovering diagrams litherest, the equipment used. (Continued from page 237)
must also be accepted with a slight allowance for exaggration

In recent years deep-water salvage of treasure ships has sxcited the cupidity of divers adventurers, and business men.
There is altogether too much wealth lost under the water to suit us. Here is what an expert diver and wrecker has to my

Within fifty miles of Sandy Hook Within fifty miles of Sandy Hook there is wealth enough sunk in the ocean sand to stock the United States Treas-ury All the private treasure ever buried in the earth would be a trife by the side of it The bottome of both the Atlantic and Pacific Oceans are vast treasure beds The man who can devise a means of traversing the ocean bottom might rival A vast amount of treasure in as accurately located as the banks of Waii Street Any experienced diver can take you to a chart and lay his fingers on any one of twenty spots and say 'Go able within fifty feet, dive deep and bring up a fortune—thirty you can't dive deep enough. A great deal of this treasure is the deposit of recent years. Still more went down before the days of ocean titiers At one time specie was trans ported in men-of war Gold dust and dia monds were shipped from mines on rickely schooners for want of better

In twenty years there were nearly five thousand wrecks on the Great Lakus. Of these over one-fifth or approximately one thousand, were total losses. The total rango issues on these wroks are esti-mated at \$12,000 000 and much of it is mased at \$12,000.000 and much of it is in indestructible form of property. These trappeles on the lakes go back to 1800, when La Salier's aligh, the 'Griffon,' dis-appeared in Lake Huron with \$13,000 in coin Besides the 'Ewable' which went down with haif a million dollars' worth of capper, the seamers' if a Coburn' and City of Detroit' were been of Sasin may Day in 1817 and 1875, with exargone stach. Name of this treasure has been re-search. Name of this treasure has been re-ceived. The steamer 'William House.' povered The steamer "William Home." which sunk in 1895 off Swishwah Point, Lake Michigan, carried to the bottom \$20,000 worth of steel billets, and the steamer "Clarion' lost in 1851 between Cleveland and Delroit, carried a deck load of new locomotives to the bottom. ions in new locomotives to the bottom. Iron and roal rargoes have been distributed freely over the bottom of the Orest Lakes and some day the milers of these ores equiliped with improved diving dress, may recover good-sized fortunes from the bottom of the lakes.

Lake Huron is considered the groater scene of treasure hunting, and it is commonly spoken of in lite lumber camps as 'The lake of Sunken Treasures' The reason for this is that back in the early reason for this is that back in the early lumbering days large sums of money were shipped to the numerous lumber camps in small vessels, and literally dos ean of these were lost. All of this noney lies somewhere at the bottom of the lake for the treasure hunter to find

Among the many important wrecks of treasure ships which are partially or treasure abigs which are partially or sately located on the charts of the gov ermunert, mention should be made of the Pacifis Mail steamship "Goldon Gate," sunk near Manzanilis, Maxico with \$200,000 in gold cein and bellion and the Khondtee steamer "islander," sunk of Douglas lissand, Alraks with \$175 000 in gold dust. The excretest prize of all number treasures—If all is true which history records—is the Spanish galleon which went down five miles off Lizard which went down five miles off Litary Point on the Cornile chart in 1754 with \$85,000 000 in gold. The Spanish Stassbill \$85,000 000 in gold. The Spanish Stassbill \$85,000 000 and the ship "Con and American" went down of Havana with a shullar amount in gold. The steamahly "Lexitagion" which went down in Long Island Sound was reported to have contained \$300 000 in specific provided to the control of the contr

The iron on your anvil tells the story of the coal on your forge

PERHAPS you haven't realized how much quick work and a good tob depend on the quality of coal you use. But you do appreciate a

depend on the quanty of coal you use. But you do appreciate a good, hot, steady fire.

Blacksmiths who have looked into the question and experimented have found that a high-grade coal especially adapted for smithing purposes is a wonderful saver of time, and remarkably increases the quality of work. They have found that

Webster Smithing

is distinctly superior to ordinary smithing coal for forge use because :

It is practically free from sulphur, fuses iron or steel quickly and insures a firm weld. Welding is impossible with sulphurous coal.

It is free from dirt or slate. In other words, WEBSTER SMITHING COAL is pure coal, high in heat-producing efficiency. It ignites quickly and burns long with an intense, steady heat.

WEBSTER SMITHING COAL has given such good results that big shops all over the country are using it exclusively. These are the shops that turn out a maximum amount of work, and winning reputations for quality and thor-

WEBSTER SMITHING COAL is mined from one basin in Cambria County, Fansiylania, and runs wholly uniform all over the country. Jours can supply it If he won't, write us, and we'll quote you prices for direct shipment in carload lots. Let us hear from you

A TRIUMPH OF MODERN STEAM ENGINEERING

MONG the many brilling successes of the steam turblue now surpasses the results which have been obtained at the Fifty ninth
Street power house which operates the
heavy service of the New York Shihway tiere by the
Introduction of a low pressure turbine between the low pressure sylinder exhaust and the condenser not only has the output of the present reciprocating en-gine been doubled, but there has been made possible se of nearly 150 per cout in the economic capacity of the whole plant

cent issue of the Scientific AMPRICAN gave a preliminary statement of the truly remarkab gave a preminingly statement or the truly remarkanion work which is being done at this station. At that time one of the turbines was in state and the tala had not been extried to full completion. In the in-terlin, more complete data have been secured, and at the last meeting of the American Society of Mechanical Engineers a paper was given by if G Stutt Super intendent of Notive Power of the Interburough Commout of the installation and its results was made

During 1908 it became apparent that the rapidity increasing traffic in the Subway would render it nec mary to provide additional power for the winter of The unit power plant consisted of nin 7 500-kilowatt (auximum rating) compound Corliss engines and three 1 250 kilowatt turbine units for lighting and signal purposes. Of these engines and gen-erator units the authors of the paper say 'In general they are the most satisfactory large units ever hullt. as five years' experience with them has proved

in considering the problem of securing an addi-tional supply of power electric transmission of power from a hydraulic plant was rejected because of the high cost of a double transmission line from the near est available water power and the impossibility of getting reliable service

The gas englue, it will surprise many of our read-rs to learn while offering the highest thermodynamic efficiency would have cost at least 35 per cent me than an ordinary steam turbine plant and its main tenance and operation account would have been from

four to ten times greater
The alternative of hullding more reciprocating gines of the type aiready installed was rejected (in spite of their most satisfactory performance) because of the high first cost and the small range of economical operation the tween 3 to a and \$ 300 kilowatta), the water rate rising very rapidly beyond these limits

As between the installation of high pressure and low pressure turbines, it was found that by combin ing a low pressure turbins with the present engine at least Sunr cont higher efficiency would be secured than with a high pressure turbine unit alone, and it was finally decided to place an order for one 7.506-kilowati (maximum rating) (urbine unit since by this means "the company would not only get an in remains "incompany would one only get as in-crease of 100 per ceut in capacity of the combined engine and turbine" "but at the same time give the engines a new lease of tife by bringing them up to a thermal efficiency higher than that obtained by any

thermal emission infair train that obtained by any other type of sizem plant.

The net results obtained with this first Installation are annuarized us follows. An increase of 100 per cent in maximum capacity of plant, on increase of 146 per cent in repartly of plant, on plant, a saving of approximately 35 per cent of the condensed sleamy for return to the boilers, an average improvement in economy of 13 per cent over

the best high pressure turbine results, an average improvement in economy of 25 per cent thetween the limits of 7,000 kilowatta and 15,000 kilowatta; over the results obtained by the engine units sione, and instity, an average unit thermal efficiency between the limits of 6,500 kilounits and 15 500 kilowatts of 20 6 per cent

These results are surely entitled to be considered as constituting the low pressure turbine one of the greatest triumphs of modern steam engineering AW AMPRICAN GINRATTAR

EY WEST, by virtue of its geographical peal tion stands in the sums strategic relation to the Guif of Mexico and the Caribbean Sea as does Gibraius to the Mediterraneau, and its navat and military importance, which have the results of the late Spanish war and the construc-tion by the United States government of the Panama Caual The transformation of Key West into a grea bayes and military station which shall rival in imperiance the foreres of (libraliar is advocated at as intimately connected as are the navy and the ma-

considerable length to an article by Commodore W H iterator II S.N., Commandant of the Seventh Naval District which appears in the March number of the Journal of the Military Service Institution - The first part of the Commodore's paper is devoted to an are-ent plea for the more complete co-operation of the army and many forces. The army and many should be rine corps, and this connection should include, as far as possible both the personnel and material Guns as pessing our interpretable and material units and ammunition should be of the same general type, with the latter interchangeable and supplies and stores should all be of one standard? It is samitted that ilose relations between the army and navy would be spheet to craftal limitations, but the Commodore urges that it is essential that the coast artillory corps and the navy should be intimately associated for the Melent defense of our seaboard definitely assigned portion of the navy to act as Navy dennicely assigned portion of the may to act as Navy-Coast-Defenders, and in this islass should be included second class battleships or older battleships, the smaller torpedo boats secuts, submarines, mine-lay lux vessels and tugs. "Thir cooperation in the de-fense of any particular navai base should be definitely nranged in time of peace and they should maneuver and drill sow, under the command of a designated officer of the coast defense service, whether he be an army or a naval officer

In his proposal to make of Key West an improgna-ble Gibraiter, it is pointed out that the present de-fenses at Fort Taylor are inadequate for the reason that lattieships can lie at the entrance bnor seven uth of Fort Taylor, beyond the range 12 inch rifle mortars, and destroy Key West from that 12 inch time mortans, and destroy Key West from that voint without being exposed to any dauger the re-maining velocities of projectiles from the direct firing 16-inch and 12 inin jume being insufficient to pene-trate the armor of any battleship, whereas these same scilber gume an aktifiship could shell the city of Key West and completely destroy it

This consideration brings the Commudore to his novel proposal for rendering key West impregnable the points out that in place of high hills or a huge rock as at fibraliar, for the mounting of coast of some guns Key West Harbor, twenty five miles in length, is sheltered on the north by a line of low reefs and shouls which form a complite protection on that side, while seven miles in the south of this line there is a paratlel line of eastern shoals, some of which are rly awash at low tide and none more than eight fost above high water. To build forts on these outer reefs would be so costly that it could scarcely be confort above high water To hold forts on these duter reefs would be so costly that it could scarrely be con-sidired, but Commodore Bechler proposes to take on monitors and older battleships which have passed their period of usefulness on the high seas, mount them in selected positions upon these reefs, and utilize them as permanent turnet forts. Thus, for instance, selecting the shoal known as Rock Key, where there selecting the shoal known as Rock Key where there is a small natural harbor, he would lighten the old monitor "Amphitrite" by the removal of her propoliting engines, haul her into the harbor, halld around the wessel a dyke of piling, rock, and riprap, and thau fill in the space between the inner face of the dyke and the ship with material hydrautically dredged and and the ship with material hydraulically deviged and deposited He estimates that the work would not cost more than \$50,000, and he claims that the sea-coast defenses would thus be increased by a double-turreted fort containing four 10-inch breech-leading riftes and provided with admirable protection. The vitals of the fort, that is the ammunition rooms, turret turning gear etc. would be pratected not only by the armor of the ship but also by many feet of the by the armor of the ship but also by many rect or the line losting earth and ripray. The deck of the monitor would be shout eight feet above mean low water, and the ripray would be carried up the sloping face and over on board, leaving only the turrets and super-

The ship as thus imbedded would furnish, says the ommodors, a complete, modern double-turreted fort,

with every necessary feature to operate the with quarters for the officers and men of the parti-son, and moreover, the entire cost of the installation son, and moreover, the entire coat of the junctuations would be less than the cost of malifications and a ship in the many for one year. The monitors "Miantonomah," "Terror," and "Puritan" could be installed upon the adjacent reefs, and the range of the sixteen 10-inch and 12 inch guns of those forts would com-mand a large part of the Straits of Florids, and especisily that part which is used by westbound vessels entering the Gnif of Mexico which navigate close to the Florida reefs to avoid the strong current of the Gulf Stream Incidentally, it may be mentioned that the dyke would be extended in each case to form a small harbor of rature for turnedo boats and sub-Referring to the proposed island fortifications for the defense of the entrances of the Chesapeake this suggested that it would be a great economy it one of our old battleships such as the "Oregon" were used as a central point about which the island could he built

he built

Now, it is a question of great inkirest and of unquestionable moment, whether this very noval preposal of the Commodere does not provide an opportunity to greatly lengthen the useful life of the bastenship in view of their enormous and rapidly
growing fruit cost the rapidity with which these
something appailing in a few years after their compited on the great such that is the first line of battle,
in ten pears time they are becaming obselve, and fin
fritten years' time they must be religiated to the limfitten years' time they must be religiated to the limthe game and struor has in the line of prover, speed,
and read engalettly. Many of these obsolescent thips,
because of their powerful armor and armanent, would
be perfectly well able to strated up in the first fightbe perfectly well able to stand up in the first fightbe perfectly well able to stand up in the first fight-ing line, if they only possessed the requisite speed and maneuvering quality, and if it should be found practicable to utilise them in the way suggested by Commodore Bechier, their powerful guns and heavy protection would render them most formidable when protection would render them most formidable when mounted as part of the purmaent fortifications of our sea-coast defenses. This suggestion is certain to excite a widespread interest, and we commend it for discussion in our columns by that large and ever-growing circle of our readers who follow closely the divelopment of navsi and military materials.

PAULHAN'S FLIGHT WEAR NEW YORK IATOR LOUIS PAULHAN succeeded last week in getting the bond which he is required to put up in case he files reduced to \$6,000 for one week, and on Friday, March 10th, he made two exhibition flights at the race track near Jamaica, L. I, before some 300 invited quests. Wilbur Wright and his lawyers were inter-cated apectators as it was thought that M Panihan would attempt to fly with his verilial rudder tied or clse without using the stabilizing flaps or allerons There was an 8 to 10-mile breeze blowing, and hy starting against the wind Panihan left the ground after a run of about 75 teet. He rose rapidly, and in rourse of the two circuits of the irack, m 2 44, he reached a height of 75 to 100 feet. The hi-plane flew well and was not affected appreciably by the passes new with same was not ancested appress lamy by the wind Despited the sharp turns the machine did not the very much in making them. It supeared to rock and pitth slightly, but was always under perfect con-trol. The descent was made rapidly and at an anglo of about 20 degrees. M Paulhan made two more cir-cuits. In 2 minutes and 38 sevends.

REQUIREMENTS FOR THE SCIENTIFIC AMERICAN TROPHY FOR 1910.

HE third annual competition for the handsome trophy given in 1907 to the Aero Club of Amorica by the publishers of the Scientific AMERICAN is now open to all aviators. As aviation has at last reached a stage where cross-country flights of a considerable distance are being made, it try lights of a considerable distance are being made, it has been decided to award the trophy for 1910 to the aviator who makes the longest cross-country flight in cacess of 50 miles, which has been fixed as the minimum distance. A round-trip flight of 35 miles each way will also fulfill the conditions. The flight me be made at any point in the l'inited States that is co The flight may venient for the aviator, who must notify the Aero Club of America or the Scientific America a sufficient lime in advance to allow of the sending of a repre-sentative of the club to officially observe it. The competition is international, and foreign aviators are in-vited to compete for the trouby whenever occasion pilowe

The dates of the international balle idane races for the Bennett trophies have been fixed by the Aero Club of America. The balloon race will be held at St. Louis on October 17th, and the aeropiane be held at St. Louis on October 17th, and the aeroplane race above the Hempstand, L. I., plains (probably) on October 23nd. Plans are also on foot to hold big aviation meets at San Antonio, Texas, in April, at Ac-lantic City, N. J. in July, and as St. Louis in October.

For once the bacteriologists and hygienists usually appear to detight in starping thoud folk ar nounce a discovery which will reassure those per who are afraid to eat green regatables. Manau thought that he had discovered soil microbes in the interior of vegetable stalks From this discovery resulted the condemunation of sewage farms and, indeed, of all market gard-ning as it is ordinarily practised, with the employment of manure Fortunately this opinion has not been shared by all bacteriologists. In order to soire this problem, which is so important from the hygicale point of view, Remlinger and Nouri have mid-riaken a series of experiments, in which they on deavored, by every possible means, to infect plants with nilcrobes in every case however, they found it impossible to obtain colonies of microbes from the Itence they Interior parts of the plants thus infected conclude that the microbes in the soil do not pene-trate into the interior of plants, but remain entirely amon the surface

NEW ARROPLANCE AT HOME AND ADDROAD

THY TABOUT K NO. 3" APRILANC.

A noteworthy acroplane so far as actual llying is
succerned is the "Baddock No. 2 of Messrs McCurdy and Baidwin, who are still working with Dr. Bell near Baddeck, Nova Scotia. As our photographs show, this biplane is an excellent fiver. It has made a consider able number of more or less lengthy flights above the ice of Lake Bras d'Or, in a number of which passengers were taken

The planes of the McCurdy and Baldwin machine

are 40 feet long by 7 feet wide at the middle, de-creasing to 5 feet at the ends The wing tips which are doubt and at inched at out of the main planes, are about 5 by 5 feet in size. They are binged near their front edges, and rocked is the usual manner by means of a fork fitting means of a fork fitting around the aviator's shoulders. The horizon-tal rudder consists of two superposed surfaces spaced 30 tuches spart, and mounted 15 feet in front of the front edge of the main surfaces. The surfaces of this rud-The surfaces of this rud-der are 12 feet by 28 inches in size. A biplane tall is also used, the planes being the same size as those which form the

as those water with the front ruder. This tail is mounted it feet from the rear edge of the main clanes. The horizontal and vertical rudders are open clanes. hipken is other words, a push forward or a pull backward on the wheel directs the machine downward or upward Turning the wheel to the right or left

steers the machine sideways.

The motive power of this biplane is a 8-cylinder Kirkham automobile motor of 40 horse-power. It is was not cooled and develops its rated power at 1,400 R.P.M., at 2,000 R.P.M. it develops its horse-power.

The radiator is novel, consisting of thirty flationed tubes 1½, feet long by 3 inches wide by \$7.53 inch like! These tubes are curved from front to rear in the same manner as the main planes, and sufficient lift a solution do support the vight of the radiator and water carried. The motor is greated to a single 7 foot 8 inch propoler having a foot pitch, by most of a tokin, the ratio being 3 to 5. The threst obtained a sufficient to drive the machine at a speed of over 40 miles an boar.

The third features of Messars McCurdy and End-

A German Antaretia Kynedition.

A German south polar expedition has been virtually arranged by Lieut Flichner of the General Staff, under the auspices of the Geographical Society Lieut Flichner announced at a meeting of the society that the expedition would start in October of this year if

the appearance would be a seen of the provision over the necessary funds were forthcoming. The plan is to send a vessel with provisions over the route followed by Lieui Blackiteon and form a depot at about the half way point to Shackiteons winter headquarters. The recutier expedition small start from Weddell Land on the opposite side of the pole and make a dash at rose with the depot as object.

Dr Penik, chairman of the Geographical Society an nounced that an anonymous donor had given \$15,000 toward defraying the cost of the expedition, and Lieut. Flichner had promises of a further \$15,000 it was hoped, he said, that they would be able to send out two

Lieut Filchner is an explorer of experience lie was one of the first to reach Lhassa, Tibet, and in 1903 and 1905 he explored Turkestan and Persia

The Life of Hadlum

As interesting and informative popular lecture upon the wonders of radium was recently delivered the wonders of radium was recently delivered the wonders of the Authors' Club in London by silf william Ramany, KCB in describing the wonders of this element the eminent chemist confined himself mainly to a description of his own investigations and experiments. In dealing with the Alpha particles are specified to the control of the silf will be a silf with the control of the silf will be silf will will be silf will be sil

Radium was the most concentrated form of energy known it is n substance which goes on changing into other things to which various names have been

ing point, and its specific gravity

given These substances were named radjum A, radium B, radium C and no on up to radium P. Some had a very brief existence issuing only thirty or forty minutes, and he had never sees them. It isnd seen radjum D which would be gone in about forty years. This was a substance rained wall looking like lead and that was nearly all he could as a shout it. There were other substance rained will like pointum which Madame Carle discovered. During this, a manation radium gave a great dead of energy generally manal feeled as light but as a matter of far radium large of the could be acknowledged to the could be acknowledged to the could be acknowledged to the could be acknowledged. It was found that I gave off about \$5.00,000 times as much heat as would be given off by the oxylydrogen blooping, which gave a temperature of over 2000 dog Crnt.
What did this energy do.* It event out the Alpha.

What did this energy do." it sent out the Alpha rays at a velocity of about 400 million per seemd, and these partities naturally sarried a great deal of energy. The Deta rays, although out should must thus anoth part of the size also carried it meadons—early owing to their raws, now booking, which exacts of that of the Alpha rays. They could decompose water and metallic substances, and in these decompositions they to the size of were surprised to discover lithium in what romained, and no traves of the copper said. It had repeated the experiment size times, and the experiments were still scoling on

THE BRAZILIAN BATTLESHIP "RIFAS GERAES" in the early part of this year the first of the dread nought battleships the Minas Geraes" about which much speculation has been rife, was handed over by the builders, Sir W G Armstrong, Whitworth & Co

of Elenick, Newcastle-on Type, to the Brazilian government thus definitely disposing of the supposition that the vessel was designed for some other power This vessel has been the source of considerable discussion, since it represents the last word in heavy bat-

cahip design, and is at present the most paperfully need warship about. Through the content of Adrial Maurity, the president of the Brazilian maval numisation in England, appointed by the government the South American state to unpervise construction.

Length, 50 feet. Breadth, 36 feet. Reread displacement, fight, 11:00 toot. Horse-power, R.Eh. Speed, H é boots. Armoor: But, block, attenting for full beight of bull, increts, block; two protective deets. 14 not not fuce Armoonent: Tweir-defaulter libest, twenty two I toot. Pour toopeds tabes.

TER BARGLAND BERESONERS' WITHER SERIES."

Busing the gun trials of the "Binas Gerass" ten 13-mek guas were trained on the broudestle and dimburged simultaneously. The combined energy of the projectiles amounted to 500,000 foot-ten, or sufficient to lift the play hedily 20 foot late the air.

we are enabled to publish the accompanying photographs and to give the leading particulars regarding this, the latest dreadought.

The gaseral appearance of the vessel may be gathered from the accompanying illustration? The overall length is 548 feet, molded breadth 53 feet, molded all length in 848 feet, molded breacht 35 feet, molded deepth 4.35 feet, displacement 15,000 tons, speed, depth 4.35 feet, displacement 15,000 tons, speed as the second reseast of the series conceptions at Barrow, is of the reciprocality form-cylinder tiple-expansion type, driving twin three-bladed propellers. The cylinders have a diameter of 38 inches for the high-pressure, Si fockes for the three-mediates, and 73 inches for the low-pressure, with a common stroke of 42 inches, and on the forced of trial at 1240 popmds pressure developed 27,112 indicated horse-power, giving a speed 2714 knots.

trial at 280 pounds pressure developed 27,412 indi-cated horse-power, grings a speed of 14 kenot.
The outstanding feature of the ressel, however, is the arrangest. The meta armor on the breadded anddehlps is 9 inches for a depth of 22 feet, 5 feet of which actions below the normal isod water line. The forward and at the factlets are protected by a trans-rers 8-link armor bullhead, while forward and att the hull is protected by 6-inch beit armoring tapering to 4 inches at the extreme ends. There are two proto 4 inches at the extreme ends. There are two pro-tective decks, the upper being 1.25 inches thick, and the water-line deck 2 inches thick. Ninc-inch armor is also need for the npper strake amidships, and the 47 inch guas of the secondary armament are mounted withinch guns of the secondary armament are mounted with in the citadel thus formed In regard to offensive arm

ament, the main battery comprises twelve 13-inch 46-caliber guns Four are carried in pairs in two turrets in tho center tine of the ship, both for-ward and aft, the remaining two
pairs being
mounted on either side amidships. in order to permit e to be trainthese to be full arc of 180 degrees, the super structure is cut away fore and aft. It will be readily seen that the upper deck of the vessel is left ciear of all ob-struction, a factor which is one of the outstanding features of the design It will be seen also that the pairs of guns for-ward, as well as those aft, are stepped, the upost pair be ing soms 12 feet shove the level of those below, so as to enable the up

per to fire over the lower pair. It will be seen from this arrange-ment that a terrific gun fire can be concentrated on either side, for the forward and aft two pairs of guns can be trained through an are of 150 degrees on either side of the center line of the ship, thus giving a fire from oither broadside, including the pair of guns amidfrom other broadside, including the pair of guns amid-able of ten 15-linch guns Morrovor, owing to a pair of guns fore and aft being set at a higher clevation, they have a corresponding sidvantage in action. As these guns fire a projectile weighing 850 pounds, this means that an aggregate discharge of 3,500 pounds can be concentrated from either broadside. In the ac-

can be concentrated from either breatests. In the secondarying belowgraph takes, drung the gun tales a full acceptance of the secondarying below the secondary to the anniabing pums on either breatest believe to training through an are of 180 degrees, it is possible to five eight 18-inch guan sheet or setting. The secondary arranement comprises 47-inch guan and 2 pounders of the quick-first gype. The cutting superstructure of the vessel has been no designed as to carry four 47-inch weapons arranged in pairs one above the either on either side of the bridge at the forward end, with a significal disposition art. These gues fire forward and aft, parallel with the conter time of the eithy, but have no considerable skiple of five shade. gues are roward and art parallel with the center line of the ship, but have a considerable shige of fire abaft the beam. Also six \$-pounders are similarly mounted forward and aft in the same superstructure, while two other \$-pounders are engried on the top of each of the

gun houses of the upper level pair of guns. On the main deck there are seven 47-inch guns monated with in the citated of Funch armor, on either side, and the arrangement is such that the guns can be trained through an are 650 segrees on other side of the outer line transverse to the keel, so that they can be trained asters and ahead. Altogether there are twenty-two 47-inch guns included in the secondary armanout two 47-inch gans included in the secondary armamont. The result is that in action the vessel can pour a broad side from ten 12-inch guns firing 50-pound shelfs, cloven 47-inch guns firing 45-pound shelfs, and six guns firing 3 poundor projectiles. As all are of the guns firing 3 poundor projectiles. As all are of the latest quick firing type, a comprehensive idea of the formidable character of the attack of this vessel may he obtained

erating mechanism is olectri hydrantically driven, electricity being used for training the turrets. In addition there is emergency go ing the turrets in addition there is emergency genr for every operation. Immediately the gun is fired an air blast cleans it and the rammer is fitted with a water spray, so that in the event of any sparks remaining when the breech is opened they may be et once extinguished The accommodation for the per sonnel is most adequate and commodious especially in regard to the officers' accommodation, and in view of the hot climate in which the vessel is to be in service special attention has been devoted to ventilation navigating bridge has outer wings, which are also re-moved when the ship is cleared for ection

This graceful structure, recently completed, takes the place of a primitive rope ferry.

THE FIRST METAL BRIDGE TO BE RESCIED IN AVSHAUISTAN.

the representatives of several powers were present therest. The trials served to dissipate conclusively many approbanions that had formerly been enter tained. For instance, there was considerable discussion as to what effect would be produced upon the gua crew in the lower bare-tie of the fore and aft 13gun crew in the lower barbette of the fore and at 13-inch guns when the weapons immediately above were discharged in the first test the crew were withdrawn from the lower gun house when the upper pair was fired. It was cound, however, that the roof of the iower house offered a complete protection against the hlast, and that the crew could safety stay in the lower house without experiencing the slightest iti effects of the tremendous blast some five feet above their heads It was also considered that the principle of setting the fore and aft guns one above the other and at a dis-tance of 36 feet center to conter was objectionable, on the pica that the siming of the upper guns would be interfered with by the flash from the guns just below. interierru with my the main from the guns just below, but here again practical trials dispersed any such ob-jections. These results, by the way, corroborate cer-tain results obtained some years ago by our own Navy Department at Indian Head, when this system of mounting, first proposed and adopted in our "Michiand "Bouth Carolina," was tested.

Cement for Aquaria - Equal parts flowers of suiphur, puiverized sat ammoniac and iron fitings, mixed with good inseed oil varnish and adding enough white lead to make a solid, easily workable mass.

THE FIRST HIVAL BRIDGE IS APPRANTATED.

The accompanying itius/ration represents the Directors are supported by the first metal bridge to be erected in Afghantian, which was opened last year. The structure opens the Kabul River at the mouth of the famous Directoith Gorry about seven mitter from Jaliabed Prior to the erection of the bridge communication was maintained between India and communication was maintained between India and the adjacent country by means of a primitive native ferryboat, or raft, composed of akins stretched taut on a framework of rough timbers, and lashed to-gular by means of crude native-made rough A cable was stretched across the river, and when the latter was at its normal stage the raft was pulled from one bank to the other by this means Whet, however, the waterway was in flood, and the turbulence and velocity of the current provented recourse to the rope the raft had to be rowed across the river, an opera which required considerable destority with the primi-tive cars used. The journey was somewhet danger-ous under the circumstances and the opposite bank was only gained some considerable distance down-atream. Owing to the rude character of the ferryboat a capelee was by no means infrequent, and inseveral lives were lost from this cause every

chosen for the structure was just off the old Kahui read As the photograph shows, the gerge is extremely wild at this point, the recky cliffs dropping straight down

The contract was Mr J R Halli day by the Cat-cutta engineering firm of Messra. Burn and Com-

pany, Limited
The bridge has
a span of 396 tower centers with a clear width between parapets of 10 feet. It is defeet. It is de-signed for pedes-trian and light vehicular traffic character of the site combined with the fact that none but unbor was available, rendered the task somewhat diffi cuit The shut-ments had to be blasted out of the solid rock, as did the roadway spproaches on either side On the Jailahad side these preparawith the setting of the foundation boits were

pleted in sevon and a haif weeks. Work then had to be suspended for seven months, as the services of the Afghan isbor was required in Kehul Upon resuming operations, work was continued without further inter-mission and the bridge was erected in the ectual working time of five months. Considering the nature working time or new monton. Considering the mature of the work, and that the unity laborers were quite unacquainted with the tools used such a performance was highly creditable. A further month however was ed in blasting out a roadway and approach to the bridge in the cliff face on the Lagna side of the river The bridge was opened by His Majesty the Amir of Afghanisten smid much ceremony and before huge crowd of natives, who fined the precipitous hillsides to witness the povel spectacle

Until a few years ago, all public coal lands were valued uniformly at a rate of 250 or 310 an acceptancy at a rate of 250 or 310 an acceptancy at a rate of 250 or 310 an acceptancy at 250 or 310 and 250 or 310 or 31 Until a few years ago, all public coal lands were at the prices now fixed

BIRDS AS WESTSAWISMS

The casual observer knows the birds as he knows the free the stone or the mea shell—an incidental object of passing interest, one of the trivial details in his every-day life The covice bird student knows the birds, few or many species, by the clothes they ine diras, two or many species, ov the chains they wear so to speak. It somewhat adept, he may even recognize birds by flight and song. Even the more profound ornithodopist classifies birds by external character—largely bill feet, length of wing and tail, number of feathers in each, etc. He is of necessity a specialist paying particular attention to classifica He is of necessity tion precognaphy of the study of plumage ornith ological esteology or some one of the sub-divisions of the economic atoms of bleds. Lew individuals among my of the classes of students mentioned sufficiently appreciate the bird as a mechanism designed to play a certain part every member like every detail of some complicated and perfect machine contributing toward perfecting the whole for its requirements
Considering the bird from this standardist and

analyzing the parts with a view to their functions it seems natural to com cause It is the enterlor extremity and because the Importance of its This one featu a hirds mechanism merits treatment in an article especially devoted to it and has, in fact re-coived such treatment.* it can be briefly reviewed only here The hill not ingly performs the func-tions of a mouth in birds, but also serves as a hand Having none at all on the posterior limbs, and only unsatisfactory substitutes on the anterior ones. bill largely in theu of a hand, and do so to a very considerable degree

As has been shown, the hill largely conforms in shape to the requirements of the more important functions that it must perform, and exhibits a very wide range of vari aty in size and shape. It is used for cutting tear-ing, and chewing food of various sorts and for various sorts, and for seizing, spearing, or en-guifing prey It is also used to dress the plumage, and by some species, such as parrots, to assist in climbing Birds' skuils, having a

less diverse range of functions than the hills. correspo smaller degree of differ entiation, but they do vary to some extent according to the habits and particularly according to the orders in the lower the orders in the lowioons, and most of the sea birds, the brain cavity is relatively small, but proportionately larger

to the higher types, such as the thrushes including

The vertibral portion of the skeleton pining indithe verteral portion of the agencial planty indi-cates the hird's descent from successful sixth common with that of reptiles Modern birds being no longer provided with reptile-like talls, as was the case with the earliest types (the archeapteryx had twenty candal vertebres the bony structure of a long lizard like tall, each vertehra supporting a long feather on either side) the number of caudal vertehrs has become re-duced to usually nine and these are short and with little apparent function, other than to support the feathers of the tail, familike, about the outer bone

The bony structure of the wings is an adaptation of the bones of fore limbs to the requirements of flight the cones of fore nimbs to the requirements of flight in evolutionary history this adaptation was principally accomplished in the lizard like progenitors of birds and the modifications since them are not remarkable. The main arm bone the hunerum and the secondary ones the nima and radius are not very differ

· Hird Hills ' by D. S. Howdish, According Homes and Cardons, July 1926, vol. III, No. J. pp. 83-87

ent from the corresponding bones in mammala. the hand, however, the first and fifth fingers have dis-appeared the index and third digits are small and artely functional, while the middle finger is greatly eveloped and furnishes the real bony support for the tlp of the wing

Wings for the great majorily of birds are solely organs of flight, in a few species such as the ostrich they are rudimentary and functionless serving at tury are runmentary and tunctioniess serving at best only to preserve symmetry in such apocies as penguins, however, while useless for light, they are valuable as flippers or paddles, assisting progress through the water in a very few cases they are used to assist the bird in climbing mushly largely while immature, as in the heatzin of South

Next to the bills and wings the feet of hirds are erhaps of the greatest functional importance. Feet and logs vary greatly, accurding to the usage for which they are designed in the ostrich, which most which they as uearly resembles in its mode of life some wild horse the development of feet and legs is strikingly like that of the feet and less of such animals. Birds like

nicher's bill 8, black skimmer's bill 4, bony structure of bird's foot cysuckies, 2, memo's bill 9, beron s bill 10, the caprey's foot, 11 c ernale), 14 gere's bill 13 and 10, bill of drouge, related to slineks, not of a barnyard fow); 18, foot and leg of rhos, South American cetts

THE RIND AS A MECHANISM

the kingdsher and humming bird whose feet are solely for perching have absurdly underdoveloped, small, and weak looking feet and legs In the hirds of small, and weak looking feet and legs In the hirds of prey the feet are practically grappling hooks, de-signed to secure the firmest hold of the virtims, the legs are heavy and strong Birds like the herons the legs are heavy and strong Birds like two neroms acc storks. and cranes, who spend much time wading, have very long legs and long, slander tors, which, spreading over a wider surface, give a support ana-logous to that afforded by snowshore. This feature logous to that afforded by snowshoes This feature is more strikingly illustrated in birds like the rails. that travel about on the yielding aquailc growth, and finds its highest development in the jacanas, tropical and sub-tropical birds of the rail family Wood-peckers creepers, and nuthatches, birds that cling a pecares crospers, and nuthatches, birds that cling a great deal to perpendicular surfaces, have very sharp claws and foct adapted to such requirements. Birds that swim a great deal have the feet webbed with a membrane extending between the toes, making very

The fiesh of hirds is no iess efficiently designed as disposed toward the fulfilling of the requirements of the birds than the skeistal structure. The mere important muscles are possibarly designed to reader the greatest efficiency. The powerful nuclei that operate the wings have their eacherages on the keel of the breathone, and the latter is particularly despit developed in hirds of most powerful sight. This is true allow of the manufact of are bird, with its immense wing area to maintain agreed for hours in suiling, and of the humming hird with its relatively small wings. driven at lightning speed to keep the hird poli

in all of the passerine or perching hirds, the muscle and tendon arrangement of feet and legs is such that the weight of the body resting on and contracting the logs draws the muscle over the main joint, and draws up on the ends of the toes, looking their grip on the perch. The same principle drives the talons of the hawks and owls into their prey
Tongues in birds are also highly functional

Tongues in hirds are also highly functional in woodpeckers they are practically barbed spears, and the extreme protrusion that they are subject to is provided for by roots that extend around the back of the head and close up

to the eye-sockets. In the the nectar from flowers.

in some species it is brush like, to facilitate handling the food, and in certain fish-eating species the upper surface of the tongue is covered with points inclined he kward, facilitate swallowing the slippery prey
The eyes of owis, de-

signed to see at night, are wonderful structures. Only a small portion of the entire eve-ball is visi-Each so ket on uples skull space The visible eye-ball is mounted on a thin bone frame, some-wint resembling a lampshade in shape, a stru ture differing radically from the type of hird's eye

The feathery covering of hirds is especially adapted to their requirements it is light offerbe carried in flight, and a poor conductor of heat poor conductor of heat and cold, affording the bird the best protection in the audden temperature changes to which it is subjected. In birds like subjected In birds like the penguins it is more like the hair of seeis than rmal feathers as thoroughly waterproof The feathers of ducks and water fowl generally are also practically water-proof The power of flight is quito dependent on the feathers both of wings and tail which in action are spread to give the greatest supporting area for the air pressure to act

ism, so perfectly do all its parts contribute to an absolutely smooth-working whole, in the bird, that the very wonder of this intricate machine passes unnoticed as a common-place

Matal filament lamps generally are supposed to be of a pretty frall nature, so that the alightest touch breaks them. This idea is counterarted by an account given in the Electrical World of a collision between given in the Electrical World of a collision between a Pennayivania eastbound passenger train and an empty engine just outside Jersey City on the morning of November Std. This accident resulted in comparatively few injuries to the passengers, due to the fact. The contract of the comparatively few injuries to the passengers, contract the comparative of the second comparative in the contract of the second considerable. One of the steet passenger conclusing in the steel plates about 18 inches. Included in the lighting evilupeant of this car were nine tangent lamps, and it is interesting to note that, after the recent three lamps were found to be in perfect the recent three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to be in perfect to the contract three lamps were found to the lamps were foun

EXPERIMENTS IN CRYSTALLISATION

The making of crystals of various kinds outside s chemical works or chemical laboratory is not often practised, because it is commonly considered that the practised, because it is commonly considered that the subject is a very difficult one or that it requires a complete knowledge of -hemistry Sub-however, is a mistaken idea from either standpoint Crysials of extraordinary beauty both in geometrical form and brilliancy of color can be produced by any purson de-termined to make the understaling successful. The accompaning illustration shows a groun of py-ramidal crystalline structures that have been formed in the national crotiers.

The red is made of hichromate of potash, the white of common alum, and the blue of sulphate of copper

Many saits can be employed that are very cheap, and after the crystals have been formed the solution left over can often be used. The geometrical forms of the crystals can be observed during their formation, and it is interesting to watch how they grow as the liquid deposits the excess of sait. When finished, they can be dried and preserved under a glass covering like wax flowers so as to preserve them for ornament and for educational purposes

To produce results as illustrated make a nyraunid out of three pieces of wool five inches long, and a quarier of mi inch square. Wind each stick with col-ton twine from end in end. Bind these three strips well at the apex of the pyramid and then for the base make a little triangle of the same sized strips each inter being two and a hair mines long. Content these firmly at the corners with sealing wax, then cover every part neatly with a winding of cotton twice Now diatend the free ends of the three longer uncon, and featen them to the base with sealing wax after which carefully cour nil the waxed parts with twine For a fine pyramidal block, ni white remojer ent crystals prepare a small quantity of concentrated on made by adding powdered alum to pint of boiling water until no more will dissolve Dip sitton twine covered tripod or pyramid into this solution, let it soak for a minute, then stand it in a plate to cool. When cold it will be coated all over with very fine creates of alum. This is the starting point to build up the flual crystallization. Examine the minute crystals with a magnifying glass, when it will be seen that the face of each crystal is triangular the corners being out off small or haw large the crystal may be, it always asmes the same geometrical form, for every sait crystailises in a form according to its nature

Procure a two-gailon stoneware crock and a c rivare a two-gainen isoneware crox and a one-gallon glass baltery jur. The battery jar should be eight laches high and six inches in diameter. Pour seven pints in beiling water into the stoneware crox & Add therein about five pounds of powdered nium, a few ounces at a time stirring the solu-

tion well with a tienr strip of gisss As soon as the hot water will dissolve no more alum it is then saturated and must be poured theu saturated and must be poured into the giass battery jar, which has been proviously warmed, straining the solution of alum by tying a three-fold piece of cheese-cloth over, the top of the jar Now piace in the battery jar a circular-like ild about ½ inch deep, such as the ild of a paste jar 8st upon this lid a piece of glass four about a time of the piece of glass four and the lid a piece of glass four and a haif inches square and upou the glass the slightly crystallized pyramid completely immersed in the solution and weighted down

the solution and weignted nown with a large almo crystal or a heavy glass stopper A small regretal or almost almost stopper A small placed upon the top of the pyramid All must now be left to cool gradually. Under so condition must the wessel be disturbed, because this

confiling must the vessel be distribed, because the would cause the alum to be thrown down in a few minutes in very fine crystale like common sait/ At the end of worst-four hours, the whole of the pr-gunds will be covered with beautifully formed crystals. At the end of fort-right hours, the premain may be 'emoved, and the alum solution made hot cross more, adding more request aim to maturate the solution; poor this solution spain has desired the solution; the pyramic with the abret glass base, affect this to

stand for a week, when it will be found to have become a mass of beautiful crystals, clustering into one solld mass. The pyramid must now be removed (the giam plate also by a slight tap) a pint of clean, cold water poured over it, then stood upon folded hotting paper twier daily drain changing the hotting paper, wiere daily for a week to nino days, when it will be found that the rystals will become almost !ransparent The pyramid belug complete it may now be covered with a smillable glass dome and it will form a unique and tustructive Several sets should be made from va salts in various colors. All of them can be carried out

ely the same manner as described for The following salts are not expensive and will give the various colors stated They will not become maist upon exposure to the atmosphere For white builst upon exposure to the atmosphere. For white common alour and name sugar, red potassitut bl chromatt, yellow, yellow prusslate of potash, dark green, double sulphate of nickel and sumonta light green (shorate of nickel)

There are very many other salts that will give a

RED, WHITE, AND BLUE PYRAMIDAL CLUSTERS OF CRYSTALS

great variety of colors the majority of them being deliquement becoming motel and melting upon ex-posure to the almosphere but these enumerated here will be permanent under all ordinary conditions

SIMPLE METHOD OF PRODUCING THE SERMAN REFECT WY W & 4 4 8 9 9

The world was startled when a few years ago, Prof Interest world was started upon a rew years ago, from Zecuma nanounced that if pieces of sodium were burned belween the poles of a pawerful electro-mag-net the spectroscope would show the D line much broadened while the existing current was turned on, and that the uriginal aspect of the line would be red as soon as the current coased

The experiment confirmed the much-discusse ory of II A Lorontz who assumed that the hitherte was as a matter of fact heterogeneous and composed of minute particles or vortices in the (ther of space baving a definite mass and possessing all the proper-ties of uegalive electricity. These particles, or var-tices, which are now called 'electrons' he conceived tiess, which are now called "obsertous" he conserved as wibrating about the common center of gravily of the atom and further that light was due to trans-verse vibrations in the other generated by these rap-lally moving electrons tr argued lorents, the atom de up of such particles or vortices, their rate or vibration would be altered by the times at force in a magnetic field and we should be able to predict their behavior with accuracy Goling back to two swinging penduliums for analogy, he pointed out that any mo-

etic itees. Fig 8.—Looking at right ancies to the · APPARATUS FOR PRODUCING THE ENIMAN REPERT ١,

tion to which the electron is subject could be re into three components one in straight lines parallel to the lines of magnetic force, and the other two at right angles to them, but since these last two can be further resolved into two circular motions (one to the Aght and one to the teft) around as axis parallel to the lines of force, we can say that the motion which the electrons are capable of making may be divided into component number I in which the electrons are moving parallel to the lines of force; component num-56 2, in which they move with the hands of the clock,

and component number 3, in which they move against the hands of the clock. Now suppose we took at the vapor of sodium in a magnetic field and along the lines of force. Consider the electrons as negatively charged, and the ilnes of force runnin charged, and the lines of force runnin oward you what will happen? You caunot see any effect of component number 1, since the electrons of that component nent are moving in the line of your vision and since electrons smit waves only at right angles to the litue of sight, hence to see the waves of component number 1, you would have to move your position and look at the hurning sodium at right angles to the look at the hurning sodium at right angies to the lines of force But with components numbers 2 and 3 the conditions are very different. Here the electrons are revolving in circular orbits and in a plane at right angies to the line of sight, and since those which move with the hands of a watch are retarded, and those against he hands of a watch are retarded, and those against the samels of a watch are accelerated the single lim seen to the spectroscope would spill into two, or as in Prof Zatumin state, where the spectroscope was of small dispersite power only a broadening of line would be observed. This then, was the experiment which startled the scientific world, startled it because our of the fundamental principles of science was apparently overthrown—the homogeneity of the atom of the chemist

Notwithstanding its value and significance the ex-NOWHERSANDING Its value find significance, the ex-periment is rarely witnessed because of the ponder outs and costly apparatus necessary to produce the di-vision of the spectral lines. Powerful gratings and magnets both exceedingly expensive have up to the magnets both exceedingly expensive nave up to the present time been used in the demonstration. The writer however has a very simple piece of appara-tus central less than \$30 with ahoas the phenome-non admirably. No takim to originality is made save in the matter of its arrangement, which has so simple as to be well within the grasp of any intelligent boy. instead of the powerful spectroscope the reader will observe in the accumpanying photograph a little inter ferometer attached to the telescope. This is a modification of Fabry's and for it the writer is indebted to the inventive genius and the exquisite mechanical ingenuity of Prof. Pfund of Johns Hopkins liniver And instead of the huge magnet used by Zee man one weighing less than farty pounds is found more than ample. The photograph shows a piece of hoard six inches long to which is attached A a ions of three inches focus. B a Nicul prism which can be of three inches focus, R a Nicol prism which can be revolved in its brans collar the interferometer D the telescope and O a spring tilp for holding the quar-ter wave plain. This appearatus is simplicity listif is always in adjustment and can be rapidly shifted to view the phenomenon along the line of aight and nt right angles to it

Instead of burning sodium let us use a tube con taining helium gas, and place the apparalus so that we may view the light parallel to the lines of farce we may view the light parallel to the lines of furce and through the hole drilled in the pule piece of the magnet as seen in Fig 1 Examine the ginwing lube before the magnet is energised and you will see sov-eral concentric reliew rings in the field of the iele-

Fix your attention upon any one of the rings which equivalent of the yellow line that would b the magnet, and lostantly the yellow ring splits into two Revolve the Nicol but you cannot extinguish two Revolve to Noon in you cannot extinguish the rings because just as Lorents predeted they are circularly polarised. Now introduc a quarter wave pints the offset of which is to produce a retardation of one-half

wave length The light is now plane polarized and can be tinguished by the Nicol—a furth-er and a beautiful confirmation of Lorentz theory to much components numbers 3 but component number 1 can 3 but component number 1 can not be seen since its electrons are moving parallel to the lines of force. Now take out the Nkol and move the apparatus Nkol and move the apparatus on as to view the light at right angles to the lines of force (Fig. 2). Turn on the current and one yellow rings is observed to break up into three Let us analyze them bearing in mind what Lorentz said viz. these lives component number I was polarized lying in a hori-

sonial plane, and that the other two, components hum bers 2 and 3, were polarized in a vertical plane ver-tical because in this position we are looking at the edges of these circular vibrations, and the effect upon us ts as if the particles were actually moving verti-cally. Now introduce the Nicol with its short diagonal vertical, two rings appear, and with the short diagonal horizontal one ring appears a beautiful con firmation of one of the eleverest rest pieces of reasoning

in the whole realm of physics there is nothing mur-

striking, more significant, and the effect which it is destined to exercise upon the future of science is siminculculable

SOME SIMPLE TESTS FOR OILS.

There are several tests which anyone can apply without the use of special apparatus, and tell something about the grade of tubricating oil he is getting ---

Pince a small amount of the oil to be tested in a

APPARATUS FOR DETERMINING THE PLASHING POINT OF OIL

nan as indicated at a in the accompanying engraving, pan as indicated at a in the accompanying engraving and heat by means of the lamp beneath As the tol heats apply a match at b. After a time a flash is seen when the match is applied, but it disappears as rapidly as it came. This shows that enough vapor had been produced to mit with the air and form an explored mistiary. The temperature, given by thermometer c, at which this overwr, is called the fashing point, as one higher temperature if a match is applied, the oil takes fire. This latter temperature is known as the burning point, and may be a considerable number of degrees above the flashing point.

Dissolve a small amount of sodium carbonate in an equal volume of water Place it, together with the oil to be tested, in a flask or beaker and shake thorough the control of the control o tity of precipitate will be a gage of the amount of acid present.

TO DETRAT THE PRESENCE OF ORIT
Drop a small amount of the oil on white or very
light-colored bioting paper The oil will be absorbed,
and the grit will be visible as small black specks on

TO FIND THE TEMPERATURE AT WHICH THE OIL CONGRALS TO FIND THE TWIFFEATURE AT WHILL THE OIL CONCELLS.
PRIL 15 parts of Glubber asize into a beaker Place
in this a bottle containing a sample of the oil. Place
over the sait a mixture of 5 parts hydrochloric aid
and 5 parts of cold water The temperature is reduced slowly, and can be observed from time to time
as the oil (blickens Any freeding mixture or even ice
can be used in place of the above.)

THE IONISATION OF AIR.

MOMY SIMPLE PERSONNETS

The terms ions and electrons have now become familiar in the explanation of electrical phenomena. Most of the investigations upon which they are based how ever have been made in rucus, and co are but little understood, except by those scientists

who have devoted their energies to their esp atndy There are however many simple exp stly due to Right, which can be made in air at the ordinary pressure, and which form a useful intro tion to the study of ionization. The accompanying illustrations represent some of these typical simple experiments performed by Mr C J Watsen of Birmingham, which aroused considerable interest at a rehis courtesy we are able to explain how they were car ried out and how they may be repeated by any inter

It is well known that if a nointed wire he com-It is well known that if a pointed wire be con-nected to one pole of an influence electric machine, and the other pole is earthed, a discharge of electric-lty will be obtained. The proof of electric discharge may be easily verified by means of a lighted candle may be easily verified by means of a lighted cannie and a gold-leaf electroscope if the former is placed on the cap of the latter, the electroscope, even if dis-posed several yards from the machine, will collect continuously the electricity discharged from the macontinuously the electricity classariged from the ma-chine Similarly, if the action is carried out in the dark, a small stream of purple light may be seen, which although excredy visible, will carries a pro-nouncedly marked indisence upon an exposed photo-graphic plate Another mothod in which this dis-charge may be ascertained in to place a condensor, charge may be accretained is to place a condenser, comprising a piece of giasa 1/16 inch thick coated on both sides with tufold to within ½ inch of its edge, opposite the point of the wire. Then connect the two opposite coatings of tinfell with a strip of the same material, which has a line out in it. When the re-verse side of the condenser is connected to earth, there will be a distinct spark jumping across the par

row gap.

If this das-barge point then be immersed in a metal box fitted with an opening which is covered with per forated sine, so that the electrified air is forred through the perforations, if the box is earthed it will be found that the air which is thus expelled is totally despired of electric charge. It thus appears that the

olectric charge is not carried by the particles of air generally, but by a smaller number of what for the

ent are generally described as ions.

veral simple experiments may be carried out to several simple experiments may be carried out to secertain the paths pursued by these ions. For in stance, take a sheet of ebonite the reverse side of which is coated with tinfoll and earthed, and place it which is coated with tinfoil and certified, and place it a foot distant from the discharge point. It is advisable to pass the sheet over a gas fame for a few seconds before each experiment, so that any electricity present in the sheet may be eliminated. When the discharge from the elsevier mension is carried out for about one second, the about will be charged auxiliarity. No visible effect of this occurrance will be

observable; but if the sheet is sprinkled with a mix-ture of powdered red lend and sulphur, and the same experiment is repeated with an obstacle of near-ounrial interposed between the quering material interposes between the disconarge point and the sheet, such as say a cross, an image of that object will be produced upon the plate. If naga-tive electricity has been discharged from the electrical point, then the sulphur will collect on those parts

Fig 12.-Foreing a discharge through a sinc sieve.

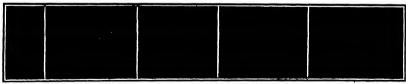

Fig. 18.—Rifect of ultra-violet rave on since

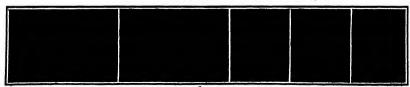

distely beneath the object, while the red lead will adhere to those parts sharged negatively by the unimpeded discharge on the surrounding areas. The drawing, Fig. 1, shows how the experiment is carried out, while the photograph, Fig 2, gives the result of the interposition of the cross in the path pursued by

The image of the object is usually enlarged, but this The image of the object is usually enlarged, but this factor is influenced to some extent by the iength of time of the electric discharge. A preferable method is to take a sheet of cellinioid, as shown in Fig. 3, perforated with holes at regular distances. Then when the image of these holes is obtained, as shown in Fig. 4, the distances between their centers can be m When the distance of the ebonite sheet is varied (the when the distance of the sponits sheet is varied (the distance of the celluloid sheet from the electric pole being kept constant) it will be found that the size of the image grows with the distance, but not proportionately. The electrified particles or lone travel along the lines of electric force, and consequently generally in curved lines. This has been proved by using, in stead of a point, a long thin wire held parallel to the interposed sheet of reliuloid when the lines of force tre circular area passing through the wire, and strik-

ing the ebenite perpendicularly to its surface
it will also be found that the streams of ions mutually renel each other, so that if the electrified point very near to the celluloid, the individual imof the holes will be found to have entered themselves at the expense of the intervening spaces and will even be observed to have assumed almost a square form, as shown in Fig 5. This is of course analogous to what is observed with the cathode rays of highly exhausted as osserved with the cathode rays of highly exhausted tubes. A similar repution is also manifested when an insulated metal object is used as the interposed ob-ject. This is illustrated in Fig. 6 which represents the effect produced by a piece of brass tubing on the end of an aboute rod, both being of the same diameter. (Continued on page 250)

Figs. 2 to 6.—Shadow effects produced by interposing non-conductors in a stream of electrified particles.

Figs. 7 to 11.—The effect of an air blast on the discharge, and of Secting a discharge through perfected also.

that the contents of the contents
the contents of the contents of the contents
that the contents of the contents of the contents
that the contents of the contents of the contents
the contents of the contents of the contents of the contents of the contents
the contents of the marbine, is as follows When the ma-chine lips to one aide it has a tendency to slike down toward the ground end wise, but as the weight is placed very low and as the fine offer resistance to this slide motion the upper part of the this side motion the upper part of the machine is retarded, while the lower part swings over like a pendulum, and the mischine regains an even keel. In the first nat the surfaces is which are of special paraffin-cated silk) were very to the state of special paraffin-cated silk) were very to the state of special paraffin-cated silk) were very the state of special paraffin-cated silk) were very the state of the state of

toose owing to for and danippess, and once the man blue was in the air it was neces sary for the aviator to sit well over to a difference in lifting power of the two sides of the machine. The biplano rose readily after a run of about 85 feet The machine is said to have tifted at a speed of about 22 miles per hour horizontal rudder was turned too far and the machine shot up to a height of 40 feet at an angle of nearly 30 degrees 40 feet at an angio of meanty '19 degrees' as Mr Herring attempted to make a turn after flying some '00 feet, and the ma-china turned successfully thipping in-ward at an angio of about .9 degrees from the horizontal and unsking a 40 degree turn. He then cut off the spark and descended In allubitur the sent was split and a runner and one of the inclined rods were broken According to the inventor, the maritime rose to the air with the sylator (who weighs 190 air with the aviator (who weighs 190 paunds) with a thrust of 140 paunds, and he believes that a thrust of 80 to 87 paunds is sufficient to fly it. The throttle was not fully opened, and the moior, he thinks developed not more than 9 horse power when the machine was in flight

This biplane is the first seroids: ily in New England but it is primipally noteworthy because of the new method of automnia stability which apparently rms to work fairly well

Mr Herring has replaced the vertical partitions of the Voisin bigiane (which partitions if the Voisin bigians (which inputed the unda industrial to ends and at various points in between) by the six small irisuguist fine shown. If these small fine placed shove the unner plane, answer the purpose as well as do the partitions in the Voisin machine, can readly see that they offer much less resistance and skin frition to the air, and should make a much faster ma-thine. They form a means of automatic stability which is a decided im provement over worping wings or mov

able wing tips (Continued on page 247)

ENGER MOTOR CAR CO., Summer and Geat Streets, Cincinnali, Chic

(Continued from page 247) concerning the seroplane which Bir Hiram Maxim has built at Crayford, Hiram Maxim has built at Crayford, Kent England No small degree of se-creey has been maintained, but to those who are acquainted with Sir illram's theories, it was evident that he would have the present aeroplane on the main principles which governed the design of the remarkable machine which he built and tested at Baldwyn's Park In 1894

The present machine is the outcome of his original researches and of plans dwitoped during the last five or six years but not until 1908 was the veteran inventor able to devote himself fully to the planning of a new flying machine He also set himself designing a gasolin motor, as he hold the idea that much of the trouble with the present zeroplanes was due to the unsultable on gines employed Sir Hiram has new evolved a flying machine in which every portion from engine to propellors has been constructed according to his own ideas. His first care was to reduce the proportions of the machine as rom pared with those of the gigantic appar atus which he constructed at Baldwyn's e is 44 feet, while his earlier multi plane had a span of over 100 feet

like its prototype, the new seroplane is of the multiplane type, and is in effect made up of six aeroplanes, sach being 6 feet 6 inches in width, fore and being 6 feet 6 in hes in width, fore and att. The planes are notably thin, and are neatly covered with waterproof sile fabric very tightly laced Poun the property of the planes of the planes of the course of the proper sile of the planes of curred as to produce automate interest are at stability to a very high degree There are balanced ruidors fore and att, and a horizontal steering ruidor. The Maxim patent device for varying the pitch of the planes when in dight was the planes of the planes when the planes of the area of the planes when the planes of the planes when the planes were planes of the planes when the planes of the planes o warping device The wings are moved in one direction by a lever worked by hand, while a spring controls them in the reverse direction

The engine is mounted between the planes, and behind the pilot, who sits in a low metal-covered compartment with the steering and control wheel in iruni of him. This disposition gives a very clear lookout, and at the same time the aviator is better protected from the the aviator is better protected from the wind A highly more feature is the pro-peiling grar. On the engine shaft is one small serve propeler mounted at the rear of the planes. This serve travels at the same rate as the engine shaft, and serves also as divided. The serves also are supposed to the serves are serves as the mounted higher to be twenty the the planes and driven by calles whose tension is outgoined by focker utilities. tension is controlled by jockey pulleys The small seres and one of the large ones rotate in the same direction, the ones rouse in the same direction, the other large into in the opposite direction. This acrew is also given a finer pitch and higher vehicity than its companion, and in this way its gyroscopic action. belances the joint gyroscopic action of the two propellers, which rotato in the Dyerse direction. This arrangement of In the engine, too, Bir tiram has shown how closely he has studied every phase of the problem. He has selected a special brand of Vickers etcel as the material for his 4-cylinder 60-horse power motor, and has been enabled to re-duce weight while leaving a good margin of strength Special care has been given to the carburder and the valves Sir with far greater regularity and amouth on than the average aerial motor on the Continent The engine is fully water cooled and the radiator is mount ed under the upper plane in a manner suggestive of that adopted by Santos Duront on his little monopianmost ingenous system of automatic

Everyday Magic

Aladdin's lamp transported its owner from place to place in the twinkling of an eye

That was thousands of years agoand the lamp was only a myth But so wonderful that the story has endured to this day

The Bell telephone is far more wonderiul-and it is a reality

It is the dream of the ages, come true. In the office, in the home it stands, as commonplace in appearance as Aladdin's lamo

By it the human voice-the truest expression of personality, ability, and character-is carried from place to place instantly and accurately And human powers are thus extended as if by magic

All other means of communication are cold and coloriess in comparison. By the telephone alone is the human quality of the human voice carried beyond the limitations of unaided hearing.

The Bell System has provided this wonderful faculty for all the people.

The whole country is brought together by the Bell policy of universal service, and the miracle of telephone talk is repeated six billion times a year

The Bell Long Distance telephone puts a man in intimate touch with new resources, new possibilities. One Policy, One System, Universal Service—these make every Bell Telephone the Center of the System.

which carries oil to every working part of the engine in a very effective manner. Indeed, the new motor promises to set a splendid example in aeroplane engia splendid example in aeroplane engi-neering, for it shows that, by skillful designing and the choice of sultable ma-terial, a light motor can be built with all the refinements which are now usually fitted to high-grade engines for motor-car work. The spasmodic action of many acroplanes at present in use is du-largely to the fact that their engine

interpretable

The new Maxim aeroplane is mounted on wheels fitted with nest shock absorbers. Regarding the machine as a whole, its riean lines and uncommon aswhole, its clean lines and uncommon spect are the most striking features. There is a noteworthy absence of the complication of stays, guy wires and framework, which on many biplanes cause so much head resistance. The grouping of the various organs has been very skillfully done, and as far as Seen very untillity done, and see he ra-possible those parts which set up most resistance are set in the same lines, one behind the other thus ministring wind resistance. In effect the whole machine bears evidence of remarkable originality, both in its general form and in its main that the second form and its main hill an apparatus like that designed by whill an apparatus like that designed to thise can drele in a captive sates around a steel mat. When see many other ma-chines, however, are experimented with in free fight by avisions of small exin free flight by aviators of small ex-perience, the Maxim method may not seem altogether necessary, aithough with a striking new type of machine it is undoubtedly a very sure course of pro

THE CLIVE BRIDGE DAW

(Continued from page 288.) cubic yards of rock excavation and 7,200, 000 cubic yards of embankment and re-000 cubic yards of embankment and re-diling. The plant of the contractor at the Olive Bridge dam consists of four cubieways, about 95 feet in height, which watend across the valley above the dam with a clear span of 1,530 feet. The crushing plant, with a capacity of 200 tons of crushed atone per hour, and the tons of crushed stone per hour, and the concrete mixing plant are located con veniently to the work, the material being brought below the cahieways, by which it is deposited as desired along the atructure Work was begun in the fall of 1907, and at the present time about 25 per cent of it has been completed

per cent of it has been completed.
The total longth of the aqueduct
(which is 17½ fort wide by 17 feet in
height) from the Ashokan reservoir to
the city line is 93½ miles, and its cent
will be about \$45,000,000. To render
the work perfectly secure and perman
and wherever the accurate and perman
or wherever the accurate and perman
or wherever the accurate and counters. the work perfectly secure and perman ent, wherever the aqueduct encounters streams or rivers of any magnitude it is carried beneath thom either by deep pressure tunnels, or by steel and con-crete pipes. The most notable pressure tunnel will be that below the Huddon River In some respects this is the most interesting feature of the work, and we are informed by Mr Alfred D Flinn, Department Engineer of the Board of Water Supply, that the borings have revealed at groat depth a granite rock emigently suited to carry this great and important conduit. In addition to a vertical boring made from a barge at the center of the river, which has the center of the river, which mass reached adopted of 708 feet, two disponal borings have been made one from either shore of the river. That from the east ern shore descends at an angle of 44 degrees for a distance of 1407 feet, where it has reached a point 70 feet where it has reached a point 70 feet where it has reached a point 70 reet from the center of the river From the west shore, descending on an angle of 38 degrees, another boring has been driven for 1780 feet, which is now with driven for 1780 feet, which is now with in 180 feet of the cutter of the river. The vertical shafts are now being suit on either shows; they will be carried down to a depth of 1,000 feet below mean high-water level of the Hadson River of (Occolesces on page 300.)

this point At that depth they will be connected by a horisontal tunnel. The aqueduct passes through the mountains, Hudson River at an elevation of 440-feet above tide level, and here vertical and horizontal shafts will connect with the 1,200-foot deep whaft at the immedi has 1,200-1001 ceep whant at the immedia-ate edge of the river, making a total dopth of 1,600 feet from the flow line to the lowest level of the siphon It is gratifying to realise that after the doubts and anxieties regarding the geological conditions affecting this work, its construction in solid granite has been its construction in solid granite has been assured it should be mentioned that the whole slybon will be fined through

out with concrete out with contrete

At Kensiro there is being built an
anxillary storage reservoir of about 40
billion gallons ultimate capacity, of
which about 20 billion gallons will be which about 20 billion galloan will be available at frow line level The elevation of the discharge will be 355 feet above mean tide. At Bearadale 4 miles sonth of Knaico, will be a large fitteration plant, and at Hillview, 6 miles to the south of this will be built another storage reser-voir with a raque ity of 390 million gal

voir with a rapacity of 930 million gai lons, the distingre being 295 feet above tide level

The kensico dam, which will be built a masonry structure 290 feet high and

1830 feet long
From the Hillylew reservoir water will be carried to the several boroughs of the city in a pressure tunnel excavated deep down in the rock beneath the boroughs of Broux and Mauhattan and under the Hariem and East Rivers to s point in the heart of Brooklyn, where it will be brought to the surface and conwill be brought to the surface and con-tinued in metal pipes, one branh lead ing north to the borough of Queens, and the other passing below the Narrows to Richmond at a point where the width is about 19,000 feet. This construction of this tunnel will confer the inestimable advantage that your at the lower and advantage that even at the lower and of

advantage that even at the lower and of Manhaitan the water will rise to a brighl of 280 feet above sea level, or say to about the top of a 20-story building The total cost of the work from and including Ashokan dam to the city line, all of which is now under contrast is \$15,004,870, and of this amount work to the value of \$10,000,000 has been com-pirted. The total cost of the whole wheme when all the watersheds have leen developed, will be \$163,000,000

IONINATION OF AIR

10FEATION OF AIR
(Confined from page 24)
The metal becoming tharged gives a
greatly charged shadow
The lons travel in a string electric
field at the rate of several ibousand feet
per second, and it is not the sir which tonveys like charge, although it is dragged along by the lons in the same manner as it is by a jet of water. This manner as it is by a jet of water. This can be demonstrated very easily by di-recting a blast of air at right angles to the path of the lons. Scarcely any defice-tion of the latter occurs. For instance, in Fig 7 is shown the image of an eb-onits rod and a glass tube produced in the manner already fescribed. The next the manner aiready foscribed. The next illustration repress to the same objects with a sirong blast of air thrown athwart the conrac of the lons. The effect of the blast is only shown issuing from the tube Just beyeast the rod (Otherwise the re-ault is oxactly the same as if there were no blast.

The experiments may be vari very wide limit, and an interesting variation is to use, instead of the shoults sheet, a plate of metal well insulated and connected to the other pole of the elecconnected to the other pole of the sloc-trical machine, instead of satthing the pole as nevirously decirbed. On the shoot of metal lay a piece of paper, and upon this sprinkle filings preferably a mixture of magnesium and black iron oxide Between the sheet and the dis-charge pole, interpose an object as b-fore, nach as the cross, and when the (Conchated on, page 251.)

The experiments of Santa-Culton Devite and Caron apparently proved that the Oriental supplier owes its beautiful color to the presence of an institute quantity of chronium in a state of oxidation lower than that which corresponds to the sequioxide, it has not hitherto been found possible to reproduce the blue color with a gentle, nor yet to obtain by fusion in the approximation of the color o

1. The Haynes at \$2,000 looks "too good to be true"

Nothing like it has ever been offered before Cars with
practically no reputation cost as much

2 The best way to prove its value is to compare it, point for point, with cars selling for \$2,500, \$3,000, \$3,500, or even more. Judge for yourself.

\$2,000—With Full Equipment

3 Take the advice of other manufacturers and investigate everything they have to offer. Haynes cars at \$2,000 are more than equal to any comparison

4 Don't buy it merely because it is made by America's pioneer automobile manufactures. Buy it because there is nothing to compare with it at \$2,000.

Roadster Dems-Tonneau or Touring type—all at the same price

Let us send you the Haynes book and tell you where you can get

THE PRESERVATION OF THE CITY HALL PARE. T is a positive inisfortune that the lack of a co-ordinated gian coupled with the astounding rapidity with which the city has been built up, to say nothing of a total wan of foresight on the part of the municipal authorities should have robbd the metropolis of the New World of the oppor-tunity to present those aggregations of magniform municipal hulidings, grouped about spacinus and care-fully laid-out plazas and public squares, which are one of the glories of the great cities of the Old World Buth publi spatis as we possess have been gradually encroached upon and their tubended visias have been close it and loo often positivity disfigured, by huttl-ings if no architectural leastly which have been run up apparently without any approviation and instainly with a total disressard of the architectural oppor

tunities thus presented and so rathlessly thrown away. Perhaps the best known of our public squares is City itali Park which early in the last century, was beautified by the erection of that gem of municipal architecture the City Hall a building which even at are not court in city limit a building while even at the most perfect place if work of its kind in New York if not in the whole in the latted States. For the greater part of a century this change building was marticulty the sole occupant of the nark und standng in the midst of its green haves and surror though not obscured by an indequate growth of tim-ber, this bimuttint structure tung remained as the dominating feature of what is certainty the most in terraiting and in some respects the most beautiful of our smaller clis marks

The first deserration of this spot occurred when the rearm assertantly in this spot occurred with the tri-sederal government erected at the spox of the tri-angle that unsightly alle which for several decades has done duty as the General Post Office, a building which not only entirely shuts out the charming view of (iv fiall and the Park which was lormerly obtain able from Broadway but constitutes in itself a monu ment to the total lack of refinement which mark public architecture of the day in which it was built.

And now it is proposed not unly to further encrosch spon the strendy restricted area of the park by build ing thereon a County Court House of colossal dimen but It is intinded, it you please structure immediately behind the City Hall, whose structure immediately behind the City Hall, whose just proportions and delicate beauty will be entirely dwarfed and rulined by the towering and widely over lapping façade of the building. Atthough it may be a palliation it is certainty not a justification of Mayor Osynor and the other city officials who favor this course, to state that they do so unwillingly and after a sincere endeavir to secure some other suitable site. For there is a possible though very costly, escape from the dilemma by means at the siternative which originated with the architects of this city and is receiving the indorsement of the leading artis tic municipat improvement, and historical societies to say outling of a thoroughly unanimous public press This proposal is that the city purchase the two block lying immediately in the north of the City Hall an place the new Court House upon the land so secured, the various departments being housed in the large offs, and other hulldings more more than and until auch time as the new Court House is ready for occu-panty. As the needs of the city demand it and tha funds become available the land so equired would be covered with other municipal buildings of a monumental character, and ultimately this group of hulldings, and the City Hall track with the present historic strucinre would form an important center with landscape and architectural effects of dignity and beauty that would be commensurate with the importance of a city which is destined ultimately to become in size wealth, and importance the leading city of the world, In giving our hearty indorsement to this proposal, we are not unmindful of the fact that New York city has now in contemplation public works on an enor-mous scale involving the expenditure of vast aums of mous scale involving the expenditure of vast anna of money But we also resists that in municipal as in other safare, conditions may occasionally arise in which sacrifice on the part of the present generation, large as it may appear at the time, may come to be required by operating as but a small price to pay for the lasting benefits conferred. The present crisis serving presents an opportunity of The present crisis serving presents an opportunity of

this yeary character

THE MAYER WAVAL REORGANIZATION TO HAVE A PAIR TRIAT.

N view of the diversity of opinion which N view of the diversity of opinion which was developed at the hearing of tha House Naval Committee that body followed, we think, the wheat course in falling to recommend any legislativa action until Secretary Nayara plan has been in operation for a sufficient length of time to ben in operation for a sufficient length of time to prove the extent of its practical utility. As to the wisdom of some of the changes which the Secretary has made, there can be no possible difference of opin-ium. The institution of a separate and independent lureau of Arrounting is one of the best reforms that have been introduced into the navy for many a decade. have been introduced into the navy for many a decade, and already at the Boston yard, where it has been for a considerable time in operation, the system has shown vory satisfactory results We are also heartly in sympathy with the pro-

posal of the Secretary to dispose by sale of those of our ulder vessels, which are so deficient in certain our unear vesses, which are so desirest in certain necessary qualifications of a modern warship as to rander the expenditure of a heavy aum of money upon them for repairs and reconstruction a very doubthip policy. A few years ugo England struck off the list and put up at autiton over one hundred of her warships, and there is no question that her navy was the better for this very drastic pruning out of and decayed material

Although the proposal to separate the work of the avy yard under the bread division of hill an terial is based upon logical grounds, and would nitimniety prove to have working advantages of a pro-tical character, we think that the proposal to separate the work is somewhat premature and this for the reason that we have not lo-day among the engineering corps, a body of men of sufficient shop e to qualify them for that oversight shops which is contemplated in Secretary Meyers pism if the institution of a separate department of muchinery includes as an indispensable corollary the training of a certain number of the navat engl neers for permanent shore duty as managers of the neers for permean it anose usey as managers of the steam engine-ering should of the navy lard the sun-cess of the plan would seem more tertain. In any case, we bettern that untit such a trained body in available it would be neighbored to continue both the steam engineering and construction shops under the management of the usval constructors Now that the Meyer plan is assured of a lengthy

period of (rist the country may rest assured that the whole of the naval service affected by the changes will co-operate in a inyal endeavor to give the nev plan such a perfectly fair trial as will serve to deter mine its practical utility. Therefore we greatly regret to see that a prominent New York daily paper has so far forgotten the dignity which attaches to its well deserved reputation, as to induige in a hitter personal attack on certain naval officers who have recently testified before the House Naval Committee, and that our confemporary has gone so far as to in-sinuate that because some of these officers were not in sympathy with certain features of Mr Meyers plan only proper course left for them to pursu tender their resignations

it is unjust and misleading for that journal to omit to state that these officers had no choice in the matter of giving testimony before the House Naval Committee, when once they had been sum Committee, when once they had been summoned be-fore that body, and that it was the whah of the Secretary that they should reply to the questions of the committee unhampered by any consideration of whether their views were or were not in harmonly

with his own So far from their frank expres ment with certain phases of the Secretary's plan showing in any sense a spirit of insubordination, we anowing in any sense a spirit of insuportalization, we rather take it to be evidence of a true moral con-age which places the highest interests of the navy above any consideration of a purely personal char-

Therefore to insinuate as does the New York Bun Therefore to instantate as does the New York with that from these and other gentlemen in the navy who may happen to disagree with certain parts of the Secretary's pian, it would be imposeible to se-cure proper co-operation during the coming months of trial, is to bettay a complete ignorance of that high professional spirit which pervades the United States Naval Service, and is nowhere more conspicuous than in that hard working and little appreciated body of officers, the Naval Constructors.

THE SCOTTISH SHIP CANAL.

THE SOTTIME SELF CLAFF.

HE STITCHES provements having reviewed the various projects for a ship canal through Scotland, whereby the Forth and the Cityde can be connected, have decided that so has a navie requirements are concerned, the most favorable rotte is that through Locks Lomond and Long, or as it is generally called, the "Low Lavel Rotte" Shut a canal the government states would unquestionship nosees some strategical value, and as they tionably possess some strategical value, and as they would financially sasies unde a scheme, the promoters of the enterprise are urged to push the matter forward in commercial interests. The government, however, stipulates that the canal shall have a foor width of 148 feet, a depth or value of 36 feet and locks 360 feet long by 110 feet wide at the entrance, will also shall be supposed to the supposed of the state of

although the mean level of the sea is practically the same on the Clyde and the Forth, the sevel at high water is not, so that a sea terel canal would p sharp tidal ourrents which would involve seriou in navigation

According to the designs which have already been prepared, the entrance to the canal from the North Sea would be a little distance north of Grangemouth, sativing inland in a northwestery direction, skir-ing Stirling on the south and running into the Forth valley which does not attain a higher elevation than 30 to 50 feet above sea level, then passing through the haunch of Ben Lomond into the valley of Em-This cut would be the heaviest on the wh route, the ridge attaining a maximum height of 260 feet above sea level But it is short Entering Loch Lomond, the waters of which are deep enough for the largest vessels attoat, the local is followed for 13 miles to Tarbet where another out is made through the nock of land, 1% miles wide separating Loch the neck of land, 1½ miles wide separating Loch Lounnud from Loch Long Tho latter would be en-tered at Arrochar and this loch, which has a very great lepth of water, is followed until the Firth of Clyde is roached opposite the Cloch Lighthouse The locks would be placed at either and of the canal that on the Clyde to lift the vessel to the level of the water in lock Lemond which is 22 feet above the mean level of the sea and the other at Arrochar regain the sea level in Loch Long

The total length of auch a canal would be 51 nau-tical miles of which 30 miles would be in canal and the other 21 miles in the open waters of Loch Loone of 191 feet near Stirling another of 285 feet, the head of the botth valley, and due of 142 seet letween Tarbet and Arrochar These cuts though The vessels will have to be deen are very whort lifted at the Forth end of the canal 13 feet at high water and 31 feet at low water, at Arrochar the lift would be 17 and 27 feet respectively in addition a regulating lock would be formed at the head of the odrick valicy to be used when Loch Lomond is in high flood,

high flood, burlier advantages of this route are the avoid-ance of river deviations only comparatively small procise being occupatered, which could be easily synthoned across the canal. Only one deviation would be necessary that of the Endrick which after all la only a stream Again, the minimum of interference will be militored will be offered. No swing bridges will be necessary and it will be possible for ves to proceed without shortoning their meets The harpest curve will have a radius of two miles. The construction of the canal will entail the excavation of 170 000,000 cubic yards of material, and its cost, t the Admiralty requirements, would approxi-

mate \$120,000,000 Work would occupy seven years Apart from its strategical value, the canal would Apar from its strategical value, the canal would have distinct attractions for commercial traffic it will offer a shorter route between America and Europe, and will avoid the dangerous passage of the Pentiand Firth The extent of this "North About" traffic as it is called, including the coastal About: Traine as it is called, including the coastal traffic, is considerable, and the saving of rows 100 to 500 miles in the see journey of his transactionic vasses, according to the situation of the European port would be an important consideration. The agregate of this traffic which would use the canal is 10,734 800 tone per annum, and at an average rate of 21 to 10,734 800 tone per annum, and at an average rate of the second cried on a saving law. 10,724 NOS tons per annum, and at an average rate of 27½, cents per ton this would yield an annual revenue of about \$4,031,800, which after deducting \$300,000 as the annual cost of maintenance, etc would yield about 3 per cent on the capital for an Admiratly cental. The actions is being actively pushed forward, and so soon as some idea of what the government would be prepared to do financially is obtained, no difficulty will be experienced in securing the se somer financial support to construct the

AERONAUTICS.

25. Adsc, the Franchman said to have flown about 1,000 feet in 1897 with his steam-propalled monoplans, the "Avion," has recently been decorated with the red ribbon of the L-gion of Honor. His machino is said to have embodied the wingwarping principle since patented by the Wrights.

Proceedings have been begun in Frunce to invalidate the Wright petent No. 145,118, of Marco 24, 1984, on the ground that the patent was not worked in France within three years, as must be done according to the statute. In asserting for antiquations and No. 193 of Mathew West Boulen, greated in 1984, whelp movides morable wing tips or "discreas" for the purpose of transverse stability in 1870 Rich and Harrie, souther Engishmen, took out a patent (No. 1469) for maintening transverse stability of means of revolving wing tips coveraged by a weight

The second annual combined seronantic and motor at show opened in Olympia, Indone (Espitalend) on March 11th Besides numerous small models, forty of March 11th Besides numerous small models, forty acroplanes and halloons were shown in addition to the regular French models of Wright, Biefrol, Farman and Santos Dumont, a number of British built duplicates were shown by weil-known firms, as the Humber Company, for example in addition to these there were a number of new sert-planes built by English inventors Interest in avia tion is very strong in England at present, and several line aviation ments are planned for the coming and

In preparing for a re-hearing of his car 19th inst, Glenn Curtiss has experimented to see how much resistance can be interposed at the ends of the planes of his hiplane without causing it to sworve d small vertical fine 1x2 feet in size, and four that these could be set at right angles to the line of flight for a few seconds without causing the sero plane to swerve from a straight path and without moving the vertical rudder. As the resistance of the balancing planes which Curties uses is far less than is obtained in the manner just described, there can be no turning tendency produced by them, and hence no use of the vertical rudder in coulu Mr Curtiss has also flown with the vertical rudder tied and with it loose, showing that a move ment of this rudder is not required. We also learn that the Autoinette monoplane has been flow with the vortical rudder left off. With these practical demonstrations of flight without the use of the Wrights' patented combination, there seems to be little doubt that any infringement suits they may institute will be successfully defended

On Sainteday March 12th, Aviator Lovils Paulban made only a sixon straight limit eligibat 600 oct. at the Jamaies race track. The strong wind of Smilles an hour velocity, and the few spectators were the principal reasons. On Sunday, however, several thousand people journeyed to the track, many of them in automobiles, and despiles a wind nearly as strong as their of the day before they were not distinct the strong strong as the first of the size o

ELECTRICITY

ha September of last your the Boston and Maine Railroad established a telephone train dispatching system on the line between Boston and Fitchburg. Mass This system proved so estimatedry that the railroad, is now about to equily two new divisions with triesphones One of the divisions consists of a belimic line, from Concord to Woodsville, N H, and the other of a 70-mile line, from Concord to White River Junction, Vt.

In a lockure before the Engineering Society at Birmingham, Sir Otiver Lodge discussed the question of protection from tightning. He stated that the problem consisted in finding the best method of dissipating the enormous energy of the flash, but that twan out wise to get rid of the energy too quickly A thin from wire is considered the best lightning conductor from the electrical point of view, but it is atmost impossible to protect a building from tight and the problem of the provided in a metal man guiless it is completely enveloped in a metal where provided with a renductor reaching up to the tallets part of the building.

Experiments made with ultra violet light show that it is more effective for sterilizing flouble show that it is more enecute for attrining requires than osone. The ultra-violet light is produced by means of moreory vapor lamps quarks tubes being used instead of glass tubes, which are placed in direct contact with the water to be nurified. A French investigator, M. Victor Henri, has found that the bacterioldel action varies growth with the distance of the lamp from the bacteria. With a Cooper Hewit ismp of 110 volts an exposure of 300 seconds at a distance of 60 centimeters was required in order to kill the bacilius coli At a distance of 40 centimel ers an exposure of 180 seconds was sufficionat 20 centimeters 20 seconds. The temperat The temperature auat 20 centinuters 20 seconds. The temperature ap-peared to have little if any, effect for the microbes were destroyed even when the liquid which contained them was frozen in treating opaque liquids such as milk it was necessary to spread the liquid out in n thin isyer For milk the maximum thickness of one inch Another investigator produces the ultra fied atmosphere of carbon monoxide, carbon suinbureted bydrogen or sulphurous acid

An interesting description of the rural telephone lines in the Ozarka was published in a recent num-ber of the Electrical Review and Western Electrician Every farmer in this region, no matter how poor he is has a telephone. The telephone lines have been installed by amateurs and every variety of telephone Owing to fe ar of lightning the connection from the pole line to the house with is ending the ends of the wires and housing her When a thunder storm approaches then: together ection is unbooked and it frequently hap pens that the owner forgets to re-establish or tion with the main line after the storm. The lines are all grounded, making it very difficult for one call another Fifty telep cunsidered a light load The times are supported on auch poles as can be easily obtained, which are sel prevent them from teaning at all angles. Tre are also used to support the lines and the branch mes eddom cut away to clear the wires. However the subscribers appear to be satisfied if only their line "talks." The subscribers usually combine to put up a switchboard in the nearest town and pay some

A very interesting method of electroplating has seen developed in England. The metal that is to be uposited is mixed in powdered form with other aub-snows and it is marely necessary to wet the powder and rub it on the surface that is to be plated. The other ingredients are an electro-positive metal, such as sine or magnesium, an inert substance such as chalk, and a sait which when wet serves as an electrolyte The following description of the process is given by the author 'The electro-positive metal constitutes the anode and the object treated the cathode, and as electro-positive metal it makes innumerable contacts with the cathode surface and acts as so many minut-These innumerable minute anodes graduelly dissolvs, and in dissolving set up in the ilquid little tocal circulations of electric current. The circuits are so excessively small, so exceedingly near together, and so numerous that they cannot be separately obd, and the surface of the metal be seat of innumerable concomitant voltaic and electro lytic actions. Thus the potential or stored up energy of the sier entary substances in the powder is con verted into electric current, and as the leave the liquid they throw down from the metallic sait is solution a thick film on the cathode, and it becomes plated over with a deposit'

ACIENCE

Prof. Lowell announces that he has discovered a new canai a thousand miles in length on Mars. The canal developed between May and September last

It is stated that many of the library newspapers, printed twenty years ago are disintegrating because our modern wood pulp paper is not permanent.

The collection of Indian contumes weapons and uteralls brought together by E.W. Lendors of Phila delphia and valued at \$40,000, has been bought by J. Pierpont Morgan and given to the American Museum of Natural History.

The astronomical clock at Hampton Court Palace has been removed for repair and repainting for the first lime for nearly thirty years. The clock, which was the first of its should in Stagtand was made for livery VIII in 1940. In 1850, it was invasify from a shed at the balace where it had lain for nearly half a century, and by order of the Office of Works was re-eved in the position which it has short or cupied in the courtry and of the pudder.

The count discovered by Daniel in December in not the same as one discovered in 1887, for which a period of about forty two years had been found than le's come has been found in being to the Jupiter family of concels having a period of about six and a half years. There are now over thirty of these and four or five of hom pass through peribelion every year, but they are in many cases so fullet as to elude observation sitegeliser.

W W Goblasta has discovered that one of the himmericans of the milky link disched himmericans in the milky link disched himmericans (Photimus pyralis) exudes when touched exhibits an intrase bits fluorescene two properties of the milk a suppose the link as a possible tray. The linescence apactron is very bright and continuous from 190₂₀ to 10 link per bright and continuous from 190₂₀ to 10 link per light which have lengths are measured (say, the unit in which wave lengths are measured that the say of the country of the properties of the link per link at the link per link at link per link at 100 links is or aroung recovered and this spectrum extended from 510₂₀ to 570₂₀. Hence the two spectra are mutually complementary

In the northern part of Archangel, which is the most northerly government of European Russia a farm for the breeding of Kameshalks ofters blue focces, sables, marriera, and other valuable fur bearing animals is being established by German capitals. The soil and climate of this district are exactly sailed to the naimals and the annual result barge is only about 5 cents per acre, no that the veniors appears very promising at fine glainer. In the other hand, a large fulfall online in required. The farm with sheet I ron which has cost \$67.000, but the bury rowing propensities of the foces and reducte will probably make it messans; to extend this barrier underground, at a large additional exp new

P Soddy finds that the groats of raidium proceeds recording to the square, of the time. On the measurables that no other intermediate bodies inference the period of the direct parent of raidium is 17 500 years. The amount of raidium present in the last prequest entitled in the state of the period of the direct parent of required, the suggests the existence of at beast one new product. Uranium Ar historication between uranium X and he parent of raidium with a prod of the order of one year if a concluded that his would not appreciably after the production of raidium according to the square of the time over the product observations have been made, but it would within the calculations of the product of the production of raidium according to the production of the production of raidium according to the square of the production of the

A German hird family has made a series of experi ments for the purpose of determining the vitality eggs in different stages of locubation. (to the fi day of incubation five canury birds eggs were taken from the nest, marked with numbers and replaced in the nest, one by one at half hour intertals. This experiment was repeated ten times with as many clutches of eggs. As a rule the first three eggs red batched normally and the two others to hatch Henre II may be inferred that the average ongevity of a canary birds eggs taken from the next on the fifth day of incubation is 15, hours in the e way the longevity was found to increase to 2 or 21/2 hours on the seventh day and 31-2 to 4 hours on the ninth day of fucubation It was discovered by accident that eggs in a very advanced stage of incu bation can endure very much longer periods of ro moval from the nest. Two eggs, purchased as picy eggs, in the course of an excursion, were or's eggs, in the course of an excursion, were stowed in a basket, brought home and forgotten O the evening of the following day a faint "beep" recalled the existence of the eggs and it was found that a young snipe had issued from one of them ond anipe soon made its appearance but fived only an hour Hence it appears that the vitality of partly hatched eggs depends on the size of the bird as well as on the stage of incubation,

An Account of a Trip in the Largest Balloon Ever Constructed

A BALLOON TRIP OF FORTY YEARS AGO.

It is doubtful whether the sensation of traveling in It is doubtful whether the sensation of traveling in an airship has ever been better described than was done forty nine years ago last Jun by Garrick Mai-lory and published in the Tritatel-pila Inquirer, Juno 30th 1860 after a voyage in the largest airship that had ver been constructed up to that time Mr. Mailory was a genis man of education and fine

Mr. Mallory was a genish man of education and fine descriptive insist and lairs communished a brigade of savairy during the civil war. Prof. T. B. C. Laws, the aromatic floating in the communished communished and the communished communished to the communished communishe

Accordingly, when on the ground, we

we re beset with gratuitous advice from self constituted professors and almospheric voyagers to the effect that it was madeess to risk the untried experiment, and to our friends we were ridiculed, threatened, joied, bribed, and wept over by turns

"So we held a council of war with ourselves in ated cool reason and positively could not see why so increase of capacity in a balloon must necessarily diminish its efficiency, or that a greater range in th amount of gas to be evolved on the orrasion, and in the number of sand bags to be retained or thrown away according to the object of ascent or descent, should destroy control over the element to be navi

"The few uncut ropes are held by strong arms, the enterprising workman who seems to desire an ascent on the edge of the basket is induced to get down and on the edge of the manet is induced to get down and put a bag of sand in his place, the other two gentlemen who determine at the eleventh hour to acquire serial honors scramble in when the awaying has begun, the 'last dying speech and confession' has been made, all "Mat dying speech and contession" has been made, all hands let go—and we are oil! We don't believe it, bowever, in the slightest degree "There is no motion porceptible, and we correleve are entirely stationary Something to be sure is the matter with the field it has dropped Perhaps that is the reason why the crowd down below there is making such a noise. They

LOWE'S DIRIGIBLE BALLOON.

are frightened, most probably. To be sure, they have some reason, for it is a rather alarming occurrence for the solid earth to fail down in that way, especially when all nature is so caim, and the sun shines so bap-plly, and our car is so nice and fixed. So we feel budly about our unfortunate fellow beings who are moseizes us that we have actually begun the great ascent, and we forthwith begin to wave the flags and hurrah and jump No, we don't jump, for there isn't room, but we would if we could. The mittee down below give cheer after cheer responsive, and run futilely in

give cheer after cheer responsive, and run futilely in our course, and we fiy away.

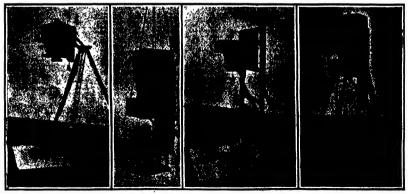

"Although nobling could have been saster than to have risen immediately to a great height, yet as the lower brases was northerly and light, we purpossly re-mained in it, as thereby a deliberate view of the city and its environs was presented that could not be hoped for once in a thousand times. We had precisely the day, the hour, the ourseat, and, above all, the balloon day, the hour, the ourreat, and, above all, the balloon for a hird's eye impaction of Philadelphia, so sailed calmiy on, slient, and ravished with octasay. At the allitude of three thousand feet we look down fundly on Gray's Perry, Darby, and the park, scenes of our coquetrian pleasures, and then turn to the sparse houses of soni rural Moyamentins, pleturesquely initiod in green takes and foliage Next we gittle on over the great city, seeming to the salesy in that not nammer evening, with naver a breath to disturb its happy rest, save the vagus murmur of life which steals happy rest, awe the wagus murmur of life which steads spward toward in, life the distant hum of invisible insects. We are higher now, and to the naked sys-vata hisliding life the Continental are distinguished chiefly by their known position, but as we pass along, the streets radiation on all sides with mathematical ex-actness, bordered with faint green lines of foliagns, and the spires point up at us with the beams of the and the spires point up at us with the beams of the sun abiling from their whiteness until the only one and the apires point up at on with the beams of the sun shining from that whiteness until they only can be likened to the hear-freat appearing on a window in winter Far away Girard College in discerned in the distance as an antilli of marbie dust, and Fairmount is found in a fairy tondstool, with the Schuylitil cur-ing close to it like a silver thread dropped, perhaps, ing close to it ince a silver thread dropped, perhaps, from the robes of Titania herself But it is perfectly in valu to attempt any description of this most ex-quisite scene, which naught but the colors of the most gifted could pretent to convey to any who have not gifted could pretend to convey to any who have not beheld it Indeed, it was all to us but a seeming ple-ture seen in an earaptured vision. There was no reality about it. We were real, and the car, but every-(Continued on page 200)

VERTICAL PHOTOGRAPHY

BY CHARLES MONROE MANSFIELD

In recording scientific material, whether plants or in recorning scientisc macerial, westers plants of their fruits, or any peruliar material of which a rec-ord in picture is valuable, the exact size is aiways desirable. Various apparatus have been constructed to support the camera and hold the subjects, but the scale servel lies in the focus of the lens. Any sub-ject placed twice the focal length of the lens from tha iens, and the kna twice its focal length from the focal plane, will give a picture natural in size. For example, a nine-inch focus iens placed eighteen inches from the subject and the focal plane the same distance from the lens will give a natural size image in focus on the ground glass without further adjusting

Nearly all actual size work is done vertically This Nearly an accusa sizes work in one vertically 'time gives the operator the privilege of maniputating his 'under ground during the exposure without inte-foring with the subject. The object to be photo-graphed is usually placed on a glass support, which may be either plain or ground, and the back or under (Concluded on page 287)

AN INTERNAL COMBUSTION WATER PUMP

THE INGENIOUS INVENTION OF H. A. HUMPHREY

wisempread interest has been aroused in European engineering circles in a new type of pump that has been even by a well-known Euglish engineer, Mr H. A. Humphrey, M. Inst, C. E. It is

hased upon an an tirely new principle, and is a revolution-ary departure from existing practice, the nevelty of the denovelty or the us-sign compelling as much attention as ency and econ

The pump is mental principle of internal explosion, but does away with all the usual work-ing parts of a gas engine, such as the piston, connecting rod, crankshaft, fly rod, crankshaft, my wheel, two-to-one gear cams and bear-ings. There are no moving parts what ever except the sim-

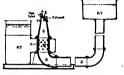

d close automati and close automati-cally, due to pressure changes, and the use of a fix-wheel is not necessary because a column of water, forming part of the water pumped, acts as a reciprocating flywheel. The water column, which also acts as a piston, has four unequal atrokes, such as theory requires when expansion is carried to atmospheric pressure. These strokes comprise long strokes during combustion and expansion as well as during exhaust, a shorter stroke during suction, and a still shorter stroke during compression. There is no valve across the discharge pipe at any point, so that the water has a perfectly free passage from the explosion chamber to the high level tank.

The explosive mixture of gas and air is ignited, as in the ordinary internal-combustion engine, and in contact with one end of a coinmn of water which ful fills the dual function of piston and fiveheed and Bills the disk runcion of piston and nywhere and mores so as to draw in a fresh combustible charge, to compress this charge previous to explosion, to parmit expansion to be carried to atmospheric pre-sure, and finally to exhaust the products of combus-tion. All these movements are brought about and con trolled by changes in the momentum, which occur naturally in the commn of water itself

In order to explain the cycle of operations in a ump o the simplest type, a reference to the accom pump o. the simplest type, a reference to the accumpant of signs with 15 from useful. The pump proper is built up from three main castings. There is the combation chamber ℓ , the water varie shamber W, and the bead β , which connects the pump to the discharge pipe D, leading to the elevated tank β . T The suction tank β . T is extended to embrace that valve-box chamber, as shown, to that there is free access of water to all the water valves V. The last spining water M and held on their satting by light optings. In the top of the cathant valve K arranged between these two valves is a simple interlocking device, so that when valve is a simple interlocking device, so that when valve A has opened and closed it locks itself shut, and re-leases valve B, and when valvo E has opened and closed it locks itself shut and releases valve A. Con sequently, each time suction occurs in the chamber valves open in turn.

For the purpose of demonstration, suppose a gaseous charge is compressed in the top of the combustion chamber C, and is ignited in the usual manner by the sparking plug, which projects through the top or or head of the combustion chamber. All the All the valve are shut at the instant the charge is exploded, and

SECTIONAL VIEW OF INTERNAL COMBUSTION PUMP.

sure resulting from the expan the increase in pressure resulting from the expanded gases forces the water downward in the pump, and sate the whole column of water in the bend B and dis-charge pipe D in motion. The column of water attains thetic energy while work is being done upon it by attentic chergy write work is being done upon it up the expanding gases, so that when those gases finally expand to atmospheric pressure, the column of water may be moving, say, 8 feet per second. The motion

RAPID TRANSIT BY BELT CONVEYOR

A PROPOSED AMPLIFICATION OF NEW YORK'S SUBWAY

The method of rapid transit by means of continu-The method or rapid transit by means or contun-ously moving endiess platforms has never as yet re-ceived the attention which its unquestionable advan-tages deserve, for, within certain limits of speed, it possesses a capacity for carrying passengers which is taged deserve, for, within certain limits of speed, it so processes a capacity for carrying passengers which is so far beyond that of any existing system as to place in a class by testif. That the system has not been put into practical application in the solution of those problems of congested city trained for which it is so problems of congested city training, which, even in the strength of the control of t

who was responsible for the electrical equipment of the Elevated Raliroads and the New York Subway system, interest in the proposed moving plat-form has been recently revived by the recommendation of the Board of Estite of this city that a moving plat form be installed in a subway extendtorm be installed in a superly extended in a superly extended from the limit to the Hudson River below Thirty-fourth Struck; and on the front page of the present issue is a sectional illustration, which shows the general character of the construction both of the sub-

smears character of the construction both of the sub-way and of the moving pistorine itself.

In those branches of our industries, for the co-nonical operation of which it is sheduistly necessary that material be conveyed from place to place at a nearthnum speed eagl with a mintum jose; it has been fessel that there is no eyeten of transpertation valled so perfectly ristillic these conditions as the best caveyor. Particularly is this tree where a great oblict of material, consisting of neces or less finely divided units, such as could twice eye wheel, here to be narried in great quantities with a riskly happen.

ruption as possible and without any manipulation by hand In this system, an endless beit moves continu-ously in a given direction, and facilities are provided for loading the material on the belt at any desired point and for unloading it therefrom at any desired

oint of delivery The moving platform is nothing more nor less than a huge beit conveyor, in which the material to be con veyed consists of the teeming millions which constitute the passenger traffic of a great city, with pro-vision for loading the passengers at any point through-out the length of the platform and unloading them out the tength of the platform and unloading them while the latter is in motion. The train consists of short jointed platforms, coupled together and form-ing an endless chain which is kept in continuous motion. This platform is provided with transverse

View of the method of driving the platforms by means of stationary electric motors and differential rubber-tired wheels. BAPID TRANSIT BY BELT CONVEYOR.

seats, and if travels at a continuous uniform speed of twelve miles per hour For transferring the pas-senger from the fixed station platforms to the seated platforms, there are introduced between them three narrow "loading platforms" which more at differen-tial speeds. The first of these adjoining the station platform moves at three miles per hour, the next at sait, and the next at nine miles per hour. The passen gar who wishes to board the train, faces the direc-tion in which it is moving, stope cuto the three-mile-per-hour platform, and, crossing the other two suc-sequively, takes his sent. The resease of the senlator or moving stairway, of which many are now in operation throughout the country, removes any doubt of passengers being able after a little practice to ac-commodate hemselves to the speed of three miles an

hour involved in boarding the train
The advantages of the arrangement as summed up
by the Chiof Engineer of the Public Service Commis-

on are as follows

1 A vastly increased capacity, and scats for all

ngers. There is no delay incurred by waiting for trains at stations, as the train is always then stantly moving

3 Passengers may board or leave the train at any

of a mile spart, as on the present Suhway, they may be placed at overy cross street, or in-deed at mny intermediate point, and

the construction may take the form of a continuous arrade

in its general construction the tun net would be similar to those built for the ordinary Rubway traffic it is prothroughout its length, with store win dows at basement level, and contious promenades between them and the barrier separating them from the Subway platforms At each street cross-ing, and if it be desired at one or more points between them ticket booths and turnstiles will be installed an arrangement which would permit ngers to board the curs practi passengers to soard the curs practically at any desired point throughout the length of the subway.

The arrangements for driving the platform by electrical power are as follows:

iows Extending longitudinally neath each platform is a pair of

beams, the upper flauges of which are riveted to the bottom of the piatform, while the lower flauges serve to support the weight of the piatform upon pairs of wheels, which are carried upon transverse shafts mounted at intervals of 2 feet 8 inches, upon concrete piers, as shown in the engraving Between cuth pair of longitudinal i beams is carried a pair of horizontal or iongitudinal rowants is carried a pair of normanical guide wheels which engage a guide rail that serves to keep the platform in proper sligment At every 76 feet, 10-horse-power motors are mounted on the floor of the subway, and are connected by a chain drive

COMPRHEED FACTS ABOUT HALLEY'S COMET.

A few facts presented in a condensed form may possibly interest the readers of the SUPYTHE AMERICAN who wish to follow the course of Halley's come in the heaving during its present appear.

asmuch as it is thereby removed from the favorite aiming point of modern gunnery, which is a little forward of the base of the foremast

The position of the 6-incb battery, with a protection of 8 inches of armor below and 6 inches in front tion of 8 inches of armor below and 8 inches in front of it, must be considered very satisfactory, although the protection is not equal to the 9 inches afforded to the 5-inch bettery on our latest ships. Except also is the protection of the smokestack to a height skip of 15 feet above the spar deck by a special stole 134 inch in thickness. The following particulars taken from The Standard of Bosnos Ayres, will be of intovest The main armor bett will except for 250 feet in the center, and 4 feet

9 inches above and 2 feet 4 inches under the normal water line, the uniform thickness being 12 inches The armored band will extend 75 feet toward noon and bow to the barbettes, but with the the kness of 10 inches only Above the principal belt of armor for the whole only Above the principal best of armor for the whole length of 400 feet there will be armor of 9 inches in the lower part and 8 inches in the upper part to the beight of the main deck. The bow and poop will also be protected by armor of 6 and 4 inches respectively On the main deck there will be a casemate with armor of 6 inches, in which the 6 inch guns will be placed. The bases of the chimnoys will be protected to 15 feet from the deck with a special steel plate 11/2 inch thick. The total wright of the armor harbeties inch thick. The told wight of the armor, parbettes, turrets etc. will be 7,000 tolus. The bottom of the ship will be protected against submarine mines with 600 tons of nickel steel. The turbine engines will be in three separate and independent compartments, and in three separate and independent compartments, and the boliers will be in six compariments, divided into two groups. The capacity of the coal bunkers in 4,600 tons and there will be tanks for 660 tons of potro-leum. The turblics will develop 39 500 horse-power with 25 millimeters of pressure of air in the boilers This, with a dispiscement of 27 500 tons, will give speed of 2.1% miles an hour for eight successive hours With this speed the radius of action will be 3,600 miles, at a speed of 15 miles the radius will be 7,200 and with it miles an hour 10,100 miles. The cost of each ship will be \$11,000,000

THE SCIENTIFIC AMERICAN FLYING MACRINE

COMMITTIONS FOR 1910

The Scientific American Tropby for heavier-than-air flying machines was offered by the Scientific American for annual competition under the rules and regulations formulated and promulgated by the Acro Club of America in 1907

Club of America in 1907
The first trial for this cup was held at Hammondsport, N Y, on July 4th 1908, by the Aerial Experiment Association of Hammondeport N Y The minmum distance to be covered was one kilometer (3,280 feet) The trophy for 1908 was won by Glenn H Curtiss in the "June Bug," he having made a flight of 5,090 feet. This was the first official public flight for a record made in the United States

The trophy was also won for the year 1909 by Glenn H Curtiss, who on July 17th fulfilled the new conditions of the competition for that year by cover ing a minimum distance of 25 kilometers. The actual distance covered was 25 002 miles in 52 minutes 30

distance covered was 30002 miles in 02 minutes as seconds, which was considerably in excess of the mini mum distance required lioth of these trials were made under the super-vision of the Contest Committee of the Aero Cinh of America

America.

In accordance with the deed of gift which provides that the conditions for each contest for this tropby shall be made progressive in their severity of test in conformity with the progress of serial nav-gation, the conditions to be fulfilled by the next per-son entitled to have his name placed on the trophy shall be a flight of not less than 40 miles across coun-iry The contest for 1910 must be held within the United States.

RULES COVERNING COMPETITIONS FOR THE SCIENTIFIC

AMERICAN TROPILY POR 1910

Acquires recover year less than the club and not of the members thereof, except in the event that any one person shall win the tropby three times, in which case it is to become his personal property. Blood the trophy to won by the regresentative of some foreign club amiliated with the Aero Cicle of America through combenship in the interpational Aeronautic Federation, it shall be held in the castoff of such club, but it shall be subject to competition

under the same terms and conditions as if it were atill held by the Aaro Club of America. Should the holding club, for any reason, be disbanded, the custody of the trophy shall revert to the Aero Club of America. Should a contest or trial under the rules not be held

Should a contest or trial ander the rules not be held within a year from the date on which a foreign com-puting macbine shall have won the trophy, the foreign acro club having possession of the cup shall give up its custody of the same and shall return the cup to the Acro Club of America, in order that the completition or trial for that year may be held in the United States of America

The conditions under which the competitive and trials shall be made shall be determined by the and trials shall be made shall be determined by the Contest Committee of the Aero Cliub of America and such conditions shall be made progressive in their severity of test, as far as possible, in order to foster and develop the progress of the art of serial savigs

All heavier-than-air machines of any type v ever (acroplanes helicopters, ornithopters, etc.) shall be entitled to compete for the trophy but all machines carrying a balloon or gas-containing envelope for pur poses of support are excluded from the competition

In order to compete for this prize the con testant should file with the Aero Club of America a formal entry, addressed to the club at its headquar-ters in New York, declaring his intention to compete for the trophy Whether the trial is to be made at

THE SCIENTIFIC AMERICAN PLYING MACHINE TROPHY.

a recognized aeroplane meeting or at a special trial, the contestant should indicate the date upon which he seeks to make a flight. He must also deposit the amount of the fare from New York to the place of

A reasonable time must be allowed for the repre-A reasonate time must be allowed for the repre-sentative of the cinb to reach the place where the flight is to be held if the trial is lo be made within 25 miles of New York city, the amount of the fare will be defrayed by the cith In case the Contest Committee find that the place of trial is too far discial present, the contestant may be required to hold the trial at some convenient place mutually to be agreed upon

agreed upon

IV The person or committee having charac of the
test or trial shall make careful meannements of the
distance covered by the flight, and shall prepare a
written report of the test or trial, which shall be
delivered to the Contest Committee of the Aero Club
of America, and in such report abail state fully
wither in bis quinton the macchine can be handied whather in his opinion the macunic can be manuful with safety, and, as far as possible, he shall determine the speed attained during the flight. He shall also take into consideration the question of stability and case of coursel, and he shall state in his report weather and wind conditions.

The flights will be made in as calm weather as

possible, but the contest committee or its representa-tive will at its discretion order the flight to begin at any time it sees fit, provided the velocity of the wind does not exceed twenty niles an hour. The ma chine may start by running on the ground or upon a track under its own power, but no special launching device will be permitted. There is no requirement as

Complete specifications of the competing r chine, giving weight, appropring surface and power of engines together with a description of the best trial of the machine, shall be forwarded to the Con-test Committee at or before the time of making entry

The trophy shall be awarded for the year 1910 VII to the contestant making the longest cross-country flight during the year. The distance covered must be

night outling too year. The distance covered must be at least 40 miles as the crow files, or to a point 50 miles distant, returning to the point of departure. The trophy shall not be awarded unless formal entry for the same has been lodged by the bona fide owner of the machine with the 'contest Committee of the Acro Club of America in accordance with the conditions elsewhere specified. The name and record of the successful contestant shall be appropriately in scribed on the trophy

Vill All tests and trials shall be under the offi-ctal supervision and direction of the Aero Cinh of America, and all questions that may arise in regard America, and all questions that may arise in regard to such contest or trial shall be decided by the Con-test Committee of said club, and its decision in all questions of dispute shall be final, and without right of appeal to a court of law or equity

'X In case the Contest Committee is unable to de ermine which machine has made the best perform nee during the year 1910 it shall arrange that a com cition between such machines be held, and the ma hine making the best performance in such lest shall wawarded the trophy for the year

X No trial or test for the year 1911 will be silowed

until the rules governing the competition for that

Correspondence.

MR RIEDERER'S PROBLEM.

to the Editor

Referring to Mr Riederer's puzzle in the Scientific Annuar dated February 19th, 1910 I take the liberty of submitting what I consider to be the most orderly

1	128	145	1 6 7	189	1 10 11

The Current Supplement.

W P Dreapers excellent emailderation of the artificial silk industry is concluded in the current Supplie-MENT, No 1786 Attention has been again directed to the possibilities of radium as a curative agent by MENT, NO 1786 Attention has been again directed to the possibilities of radium as a curatic agent by Sir William Ramany and Sir Lauder Franton. For this reason an article on the subject in the current SUPPLEMENT should be read with interest Lucion. Fournier dowribes the freezing process which was em-ployed in the construction of the Paris Bubway Tho case of Wright versus Paulhan, and some extracts from smdavits and Judge Hands decision in the case of the Farman and Elériot acropiance is corcluded H. Thurn writes on airships, wireless telegraphy, and atmospheric electricity Most interesting is an article T Kume on Japanese particulture, in which he isiders the pearl historically in Japan, mentions the by T considers the poarl historically in Japan, monitons are Oriental bivaives which produce the best pearla, and then describes in dotall the method employed by Miki moto for the artificial culture of pearls. Some experithen describes in odula the method employed by Miki moto for like artificial culture of pearls Some experiments on the expansion of air by heat are described. Automobilists will read with interest an article on a variable stroke gasoline motor Prof T J J See contributes a thoughtful paper on the origin of the sters, in which he endeavors to show that these wonderful craters may be explained by the impact of some sort of projectiles W Nernst contributes an article on general and physical chemistry in the last

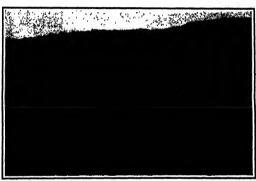

A NEW TELEPHOTO CAMERA ---It may seem far easier than it is to construct a It may seem far easier than it is to construct camera which will give an enlarged image so as to bring out the datalis of objects at great distances. To give a large, image a long focus is not in required, of four foot focus for example that a camera to use this lens must be of vry great length and weight, and connot, therefore, be said to be portable

in the instrument illustrated which was designed on the Vuetter Dufour and Scha aystem, the inventors have solved the problem of preserving the focal length have solved the problem of prescrime the rown lengths of the lons and it he same, thur reducing the volume and which of the apparatus by cutting the focal length into thirds with the said of two mirrors. At 15 who have which lies in the upper part of the double low the 155 was basing through the lens are reflected from the input part of the double low. The 155 was basing through the lens are reflected from the input mirror M placed at the back of the lower statements. box to the introd M' at the front and of the lower section, and themes to the usual ground glass P at the lox to the most of the neual ground glass rather section, and theme to the neual ground glass rather back in this manner a camera of sixteen inches hearth is sufficient for a lone of four-boot focus, with an evident saving in weight and reduction of volume built an instrument is quite portable. The upper part is the contraction of the property of the categories of the contraction of the categories of the drawn up and out of the lower box when the photo-

Up to the present time the different combinations of lenses for telephotography have all had one great or consecs for receptorography nave all had one great faull namely, a want of luminosity and consequent difficulty in focusing it was simost impossible to the satch benes for snap shots. The camera illustrated takes instantaneous views in the usual way Tho

The city of Neuhausen and the Rhine Falls taken with an ordinary camera.

A photograph of military maneuvers taken with an ordinary camera.

lons opening is always in ratio with the focal length of the lons, 10 to 12 for the extra rapid. The luminosity is thus always sufficient for instantaneous work. For the photography of inaccessible places, such as mountains or details of architecture or scenes. in which the interesting spot is at a great distance in which the theresting spot is at a great distance from the observer, the new camera performs very good work, as will be notired in some of the engrav-ings presented here. In a balloon the new system ers it possible to take rapid instantaneous views which would be impossible with an ordinary tele-objective Such views are very difficult to take, not only because of the distance

only because of the distance
of the objects, but because
of the continual movoment of the balloon, which
makes rapid anap-shots
necessary Snap-shots can now be taken up to 1-1,000th second which would be quite

second which would be quite impossible with any tele-lens with which we are ac-quainted. At the full open-ing the present lens gives pictures which are sharp up to the edges of the plate. The present camera has alrealy undergone trials in free bullence on board the

O is the lens, the rays passing tenough this lens are reflect of from the mirror M to the mirror M' and from there to mirror M' and from there as the ground glass !! In this manner a camers of 16 belies 'n length suffices for a lens of its lights from

manner examers of 18 husers of the beautiful control of the contro

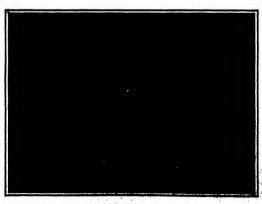

its use in field work is shown in two of the annuxed riews representing army manouvers. In the first

view, taken with an ordinary camera, the troops in the background can hardly be distinguished, while in the second view we clearly see the individual solders and can follow all their movements with sase. One of the view shows a photogramy, taken on board the ballion. "Mars," of the town of Nenhausen and the Rine Palls at an altitude of 1,400 meters (4,400 meters (4,400 meters (4,400 meters (4,400 meters) with an ordinary camera. The second view is taken from the same point with the new apparatus. Its use in architectural work is also seen

Why Are We Right-Handed?

Why Are We Bight-Handed; are we as a man, A. R. N.
From time to time ambidenterity is extelled as generally desirable, and there are to-day educators who consider that development of the left, cocqual with that of the right hand should be begin with that of the right hand should be begin with the entrance of little children in our achools. It is, there fore, porhapp profutable to discuss in what mannar right handedness—by which I would here connot on the contract of the con right-aldrdness in general—has become habitual among 96 per cent of human kind; and whether ambidexter-ity is really desirable

ity is really desirable. The fove animals, at least those which have not been taught tricks, use their fore paws indiscrimitately, the cat strikes at a five plays with a mouse indifferentity with either or both paws; the squirrel manipulates nuts and cliugs to branches quite as indifferentity. Even in monkeys to branches quite as inanimals use the fore paws mostly as hands, there is no suggestion of preferential use or superior experi-

s in the left or the right hand, states Dr. G. M Gould, but animals can be tu-tored to use one or the right paw; the mon-key to shoot man-wise, with the mus-ket butt at the right icer Among ose small-honded-as is due to arresthandedness and am bldexterity have been found to reach a proportion of fifty per cent. But as we tionary scale of nor-mal creatures, and as we exclude disease, we find that ambi-dexterity progressive-ity gives way to sinale - handednoss--con oraily right-handed-ness Sir James Crich ton Browne observed quite truly some

Army maneuvers taken with the Vantier-Dufour cursors.

years ago, that "by the superior skill of his right hand man hath gotten himself the victory" in the sevolutionary struggid. To try to undo his darken pre-emisence is to make for devolution Glimpses of

right-handedness in man, it seems, are manifest in the bronse age and in Paleotithic times It is evident in in Paleotthic times It is evident in the art of the ancients—Assyrian Grecian, Rgyptian Historic investi gation shows that all peoples, how-ever savage, have uniformly used by preference not only one but the same hand—the right. It is said that some races to-day manifest either handed ness, but this is in the last degree doubtful Such statements have, for doubtful Such attacments have, for example, been made concerning the Japanese—that they are by law and practice ambidestrous. But Baron Komura has given positive assurance to the contrary Sir James believes it doubtful whether 'strictly speak lag, complete ambidestry exists in any fully developed and civilized hu

any fully developed and civilised hu man beings, though sometimes very close approximations to it occur." Most human beings, then, are right-handed, though of course, there are those of great institlectuality and force who are ambidestrous having educated themselves to this end, and are exceptional by reason of the pseudostrous having oducated themselves to this end, and culiar and special training they have undergone The origin of right hand

undergone The origin of right hand undergone The origin of right hand ednoss will be found, I believe, to lie much deeper than the individual's voluntary selection whether he will use his right hand or his left, or whether he will be ambidextrous, the reason is to be found in human

in the position of the heart, and in the cerebral structure and organization by which latter all voluntary movements are directed and controlled Consider in the first place how the heart and its

great arteries are left-sided, though in the primor dial organism from which we have evolved there was, it seems, no such symmetry. The savage, from time immemorial, has protected his heart with

his left, his shield arm, but his aggres-sive mantpu lations are made with his right, his spear arm The modern savage though too, bears no shield — which would be use-less against modern weapons - fires his masket uni formly (in a double sense) from the right ahonider, sighting with his right eye, the sword also right

Again, in ob dience to the universal need for barter-so Dr Gould points outthe primitive practice low numbers, one to ten The fingers of the free dextrai hand were first used, and all fingers are now all fingers are now called digits, as are the figures them selves, and the basis of our numbering is the decimal or to fin

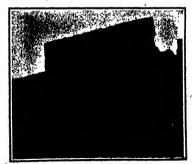

gered system
The second Impor anatomy is that all anatomy is that all our voluntary move-ments are directed and controlled in the cerebral structure and organization The Tho spheres, of which the right presides, by monne of cortain de-

cussating nerve fibers, over the left side of the be

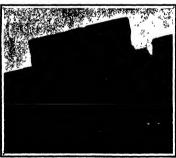

consating merro sinces, ever the left side of the body, while his left brain presides over the right side And functional difficences in the two sides are connected with and conlinear upon differences in the two heat handless of the side of the body, sounds it is blood to the side of the side of the body, sands it is blood to the side of the side of the body, sands it is blood to the side of the body, sands it is blood. iast side of the body, sends in a cood with greater force and directness to the left brain. It does send the blood more directly into the left side of the neck, but the flow of blood at the base of the hrain is so equalized in the "circle of Willia," that the theory the "levie of Willis," that the theory here stated can hardly be accepted as contunitive Besides, it is contradicted by the cases of left-handedness (whith make up shout four per cent of humanity) in which the heart is on the it't side, precisely as with the right handed.

An extremely important engineers consideration is that in right-handed people the "speech center" is situated in Broca's convolution in the cortex of the left frontal lobe, while in lefthanded people the speech center is in the same position, but in the right frontal lobe Now It has been found the left hemisphere deprived the right

no feet hemisphere deprived the right not speech, which is unimpaired in the man under the same circumstances, the man would suffer in the same way, were (Continued on page 268)

THERMAL TREATMENT OF STEEL INGOTS

BY J. F. SPRINGER

There are two considerable imperfections which accompany the casting of steel ingots. The more conspicuous one is that of the pipe. This is a conical castly which forms in the upper particle. In Fig. 1 we have by the control castly included a considerable of the control castle of the castle of t

from sit; lugars white exhibit the pipe very theart. In small explanation of this currious formation regards it as a consequence of contraction \(\), and define as a consequence of contraction \(\), and define the local and is told when the togot has cooled off. There is it is at schemeric loss of perhaps the contraction \(\) and while the whole the loss of perhaps the contraction at the moment of solidification controls this matter \(To this, however, the an every is made that gray out from expands at this moment and very life from a pipe Winther steel expansion contracts in the act of first first normal and very life from a contraction of the co

material as may be understood by using the substantial character of those shown to Fig. 2 1 hir cooling effect is consequently a considerable factor. The first solid metal if his cooling ingent will constitute a shell of the cooling ingent will constitute a shell of the shell will undoubtedly standily contract. As this goes on, it works a shell of the shell will undoubtedly standily contract. As the goes on, it would be exceeded. There would have a risk a tendency to a "met," with the shell upon final cooling larger in cross section than would otherwise have been the case Of notres, the solidifying material contacting further, one may conserve that, as the shell these, successfue layers will come to normal temperature with expanded cross sections, for reasons similar to those iontrolling the outer shell. If as much is granted, it is easy to see that therm is a tendency to leave the region of the axis empty. There is, however, another incidency at work seeking to untilify this. This is the gravitation of the did metal. This tends to fift up the sign as the bottom. And so the over portion of the loger becomes solid throughout the color of the loger becomes solid throughout the politic heave importion, with the nail that a pine really forms, and that it is more extensive to cross sections, not one seconds.

To eliminate the pipe many procedures have been employed. These divide the meet less into the mechanical methods and thermal ones. Perhage the most successful principal which has yet found the way into commercial practice is the Harmet procedure described in an artisk by the author in the 80 weeks August August August 1, 1909 Methods, such as this, operate

with a view of eliminating the pipe through the foreing in of its walls upon themselves while the interior of the ingot is in a liquid or plastic condition the elaboratones of the apparatus necessary, and the length of time required, are serious considerations

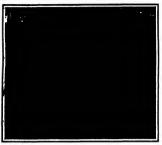

Fig. 1 —The six transverse slabs and the right-hand vertical slab were poured by the hot-top process.

which operate against some, at least, of the mechanial processes. But offers have been made to solve the problem by thermal mean. If the steel at lively could be kept highly liquid until the lower part of the inget becomes solid, then with such a reservoir perhaps the pipe could be progressively filled uple at the formed. Upon some useful fundamental jets the thermal processes depend Krupp is said to have pour motion size upon the tops of the lingest Amazemity
